I wrote this book!

# A story map is a simple way to tell a story and break it down into parts

Stories are meant to  
solve 2 problems

and neither is about writing better  
requirements

Written requirements  
don't work the way  
you think they do

# Imagine a simple phone conversation...

Jen Yates' Cake Wrecks: [www.cakewrecks.com](http://www.cakewrecks.com)

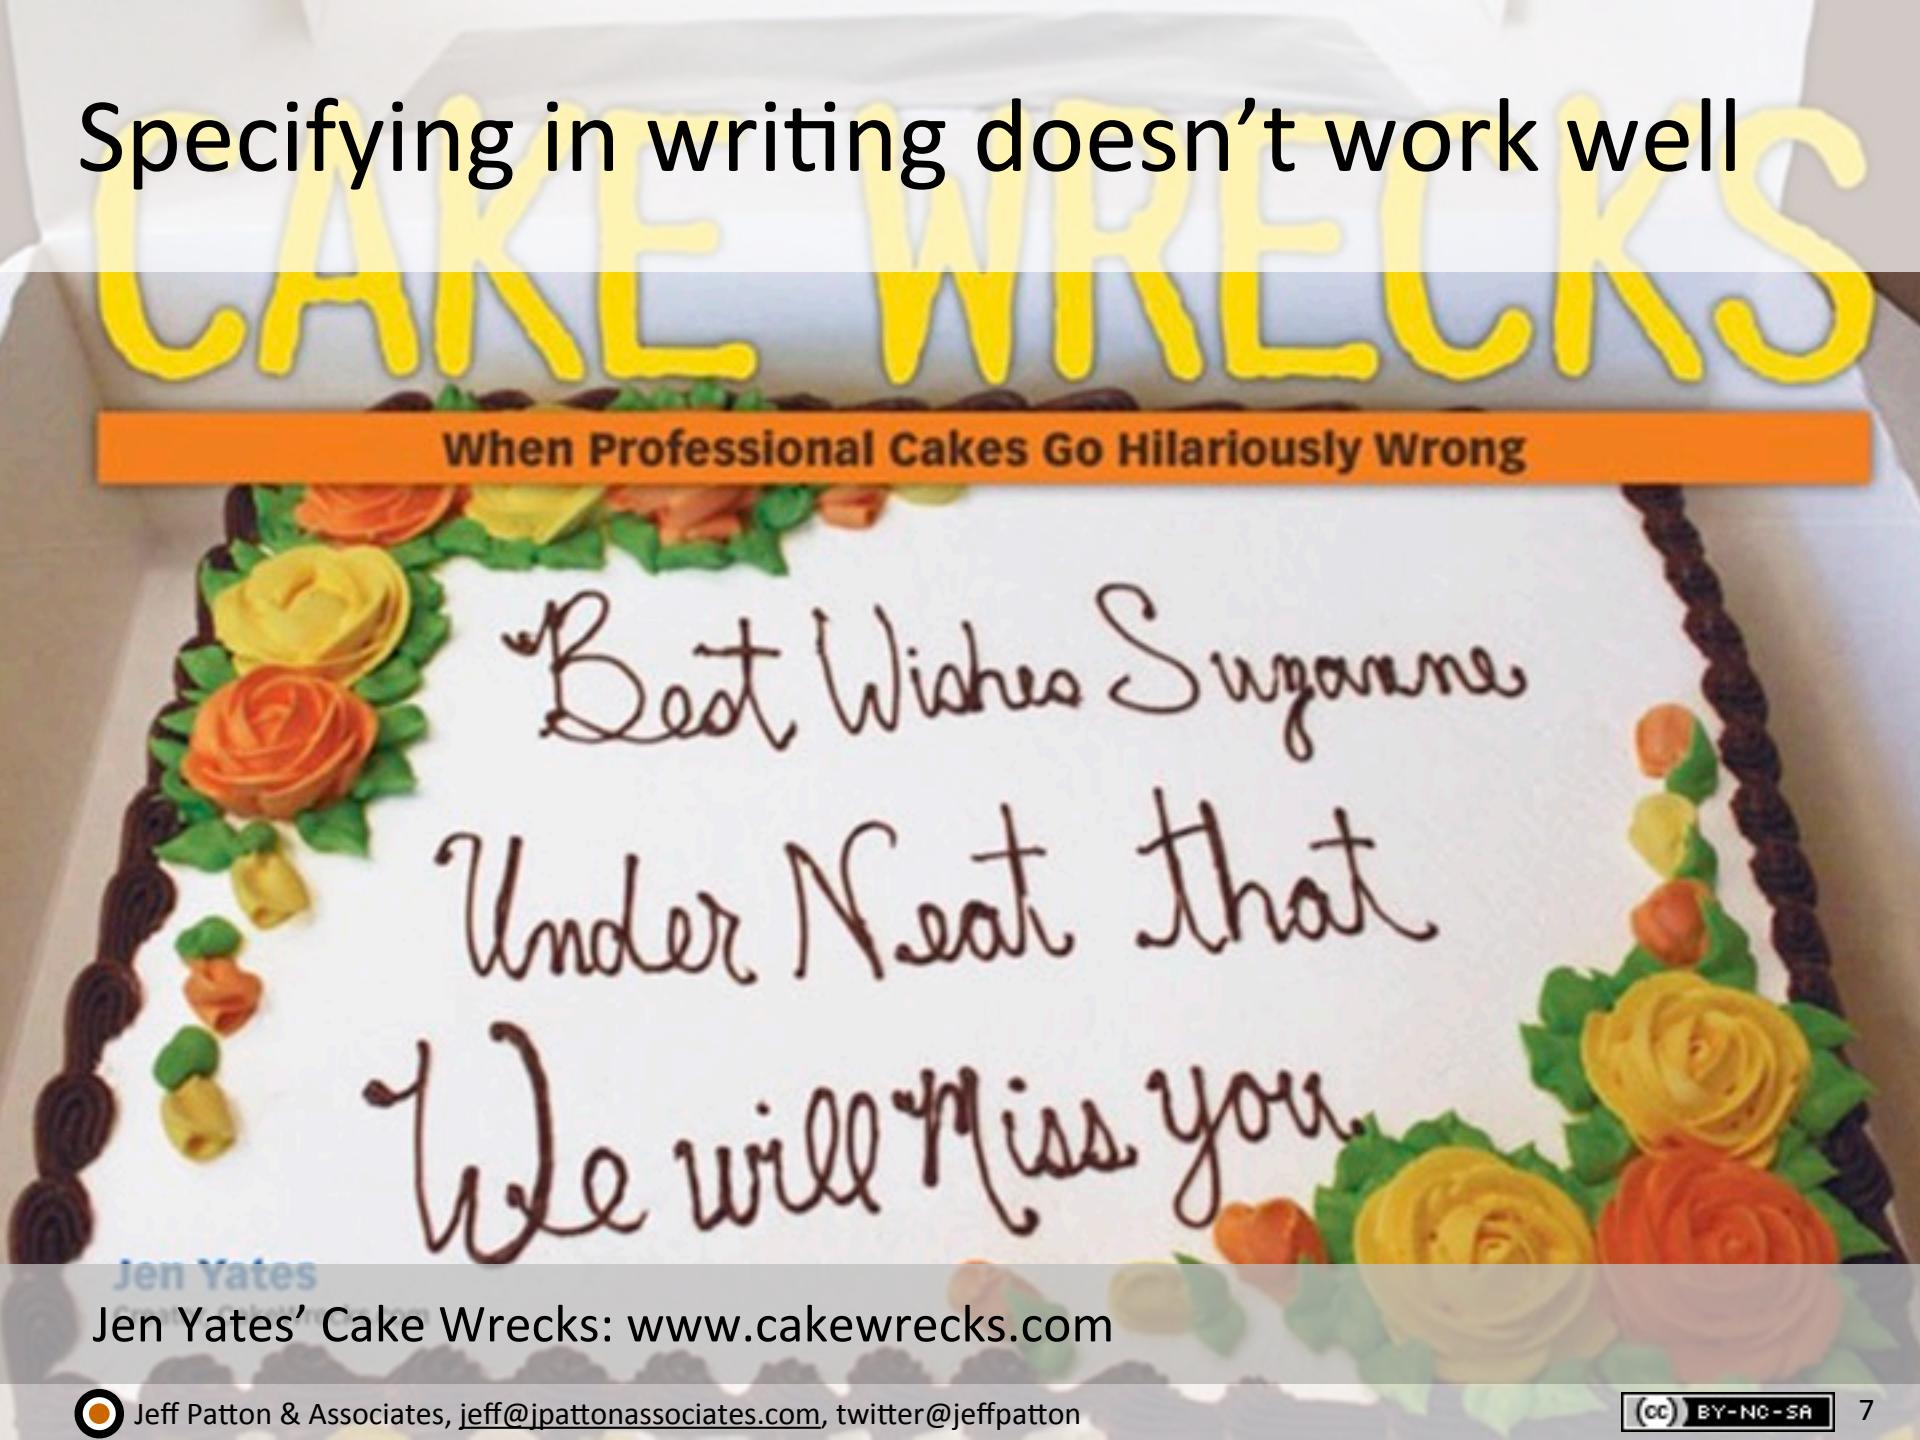

# Specifying in writing doesn't work well

The image shows the homepage of the **CAKE WRECKS** website. The header features the title "CAKE WRECKS" in large, stylized white letters against a blue background, with the subtitle "WHEN PROFESSIONAL CAKES GO HORRIBLY, HILARIOUSLY WRONG" below it. To the right of the title are two cartoon babies riding on carrots. Below the header is a navigation bar with links to Home, FAQ, Press, Contact, About, and Stuff. To the right of the navigation are social media icons for RSS, Facebook, and Twitter. On the left side of the page is a sidebar for the **BlogHer Food Network**, which includes links to Advertise, Privacy Policy, and AdChoices. It also lists "More from BlogHer" including Sun-Dried Tomato Pesto, Grilled Chicken Pitas with Cucumber Yogurt Dressing, How to make Kala Channa Subzi, Moms Blog About Motherhood Before and After Delivery. A featured article titled "What The H?" from October 16, 2012, is shown with a thumbnail image of a cake decorated with green frosting and small figures. The main content area displays a large image of Jen Yates' book "CAKE WRECKS: When Professional Cakes Go Hilariously Wrong". The book cover features the title in large yellow letters, a photo of a cake with a "Best Wishes Suzanne" message, and Jen Yates' name at the bottom.

## Mystery of Orbiter Crash Solved

By Kathy Sawyer  
Washington Post Staff Writer  
Friday, October 1, 1999; Page A1

NASA's Mars Climate Orbiter was lost in space last week because engineers failed to make a simple conversion from English units to metric, an embarrassing lapse that sent the \$125 million craft fatally close to the Martian surface, investigators said yesterday.

Officials are scrambling to determine whether a similar error is buried in the computer files of two other spacecraft currently cruising through space: the Mars Polar Lander, scheduled to hit the Martian surface on Sunday, and the Deep Impact comet mission.

... engineers failed to make a simple conversion between English units and metric, an embarrassing lapse..."

Scientists do not yet know what caused the Mars Orbiter to crash. (AP)

## Sometimes mistakes are less funny

# When we share and sign off a document we may believe we understand

I'm glad we all agree.

# Kent has a disruptively simple idea

# Stop it.

# Stop exchanging documents.

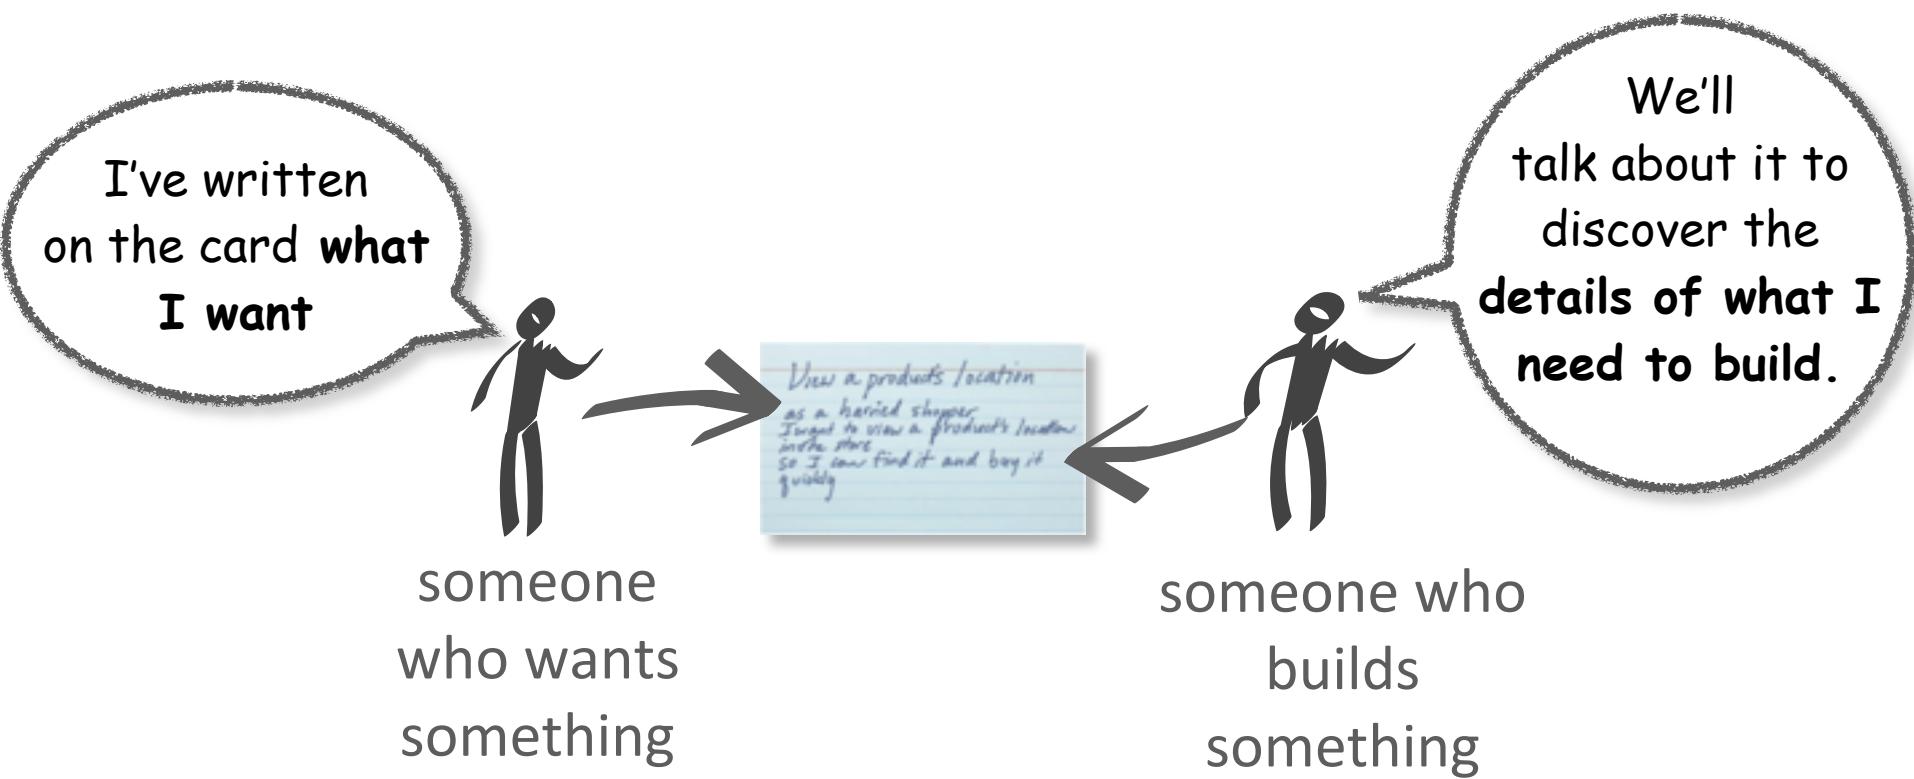

# Tell me your story.

If we we could  
just talk about this, we  
could figure it out  
together.

# The original idea of a story was simple: use it to facilitate a conversation

Stories get their name  
from how we use  
them, not how we  
write them.

But, we still managed  
to screw that up

# This is a Scrum backlog grooming session

blah blah  
blahdy-blah  
b'blah blah  
blahdy-blah blah  
blah blahdy-blah  
b'blah blah  
blahdy-blah blah  
blah blahdy-blah  
b'blah blah  
blahdy-blah blah

This is JIRA  
projected on  
the wall

About 3 of 10  
people actively  
engage

He's not raising  
his hand to speak,  
he's yawning

He's secretly  
reading email on  
his smart phone

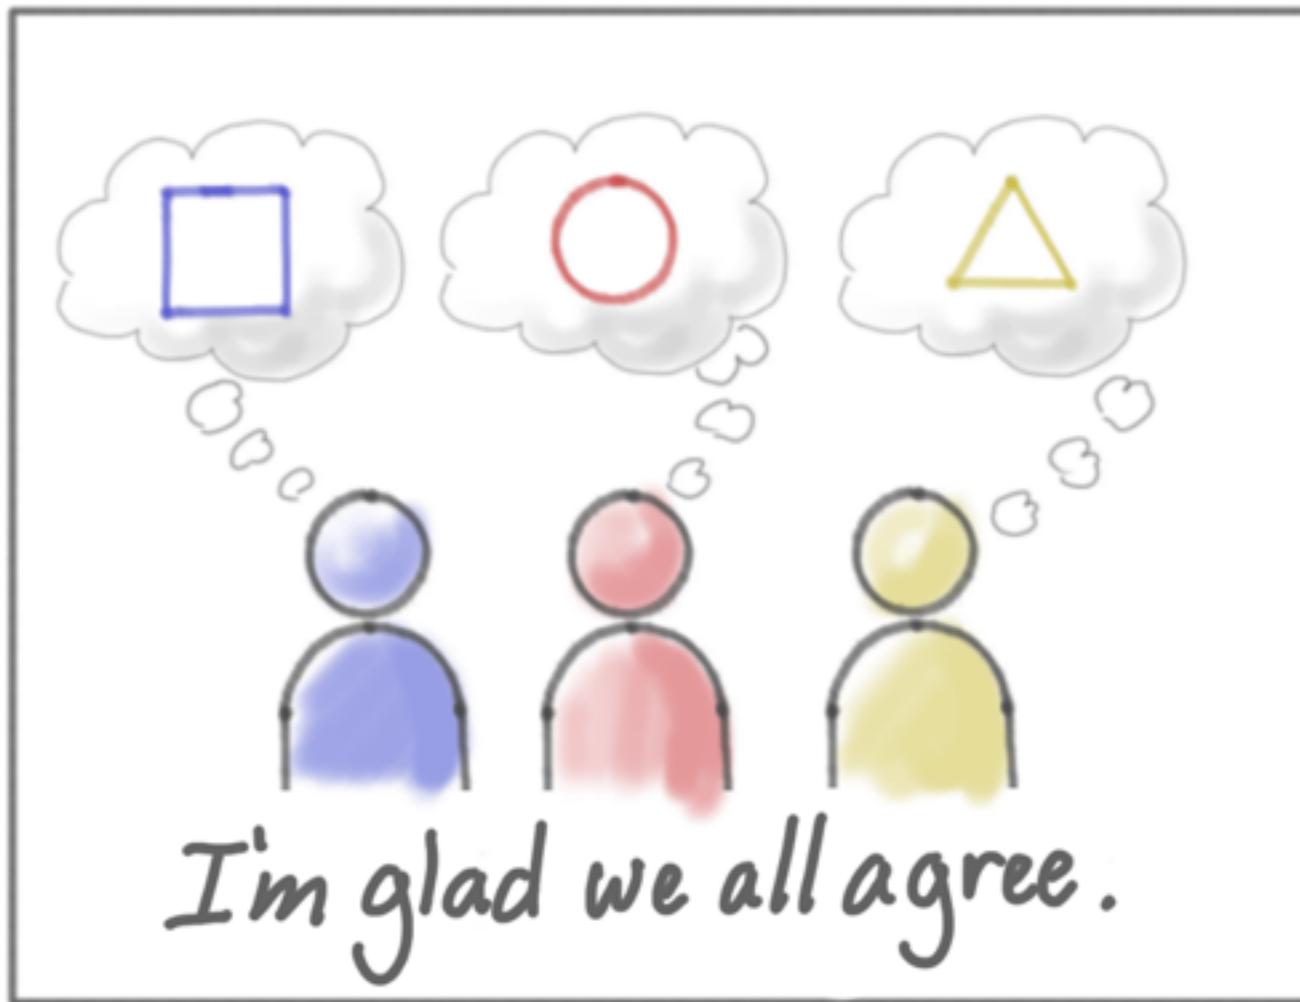

This isn't the kind of  
conversation Kent  
had in mind

Something special is  
going on during an  
effective conversation

# With a shallow discussion, we may all take away something different

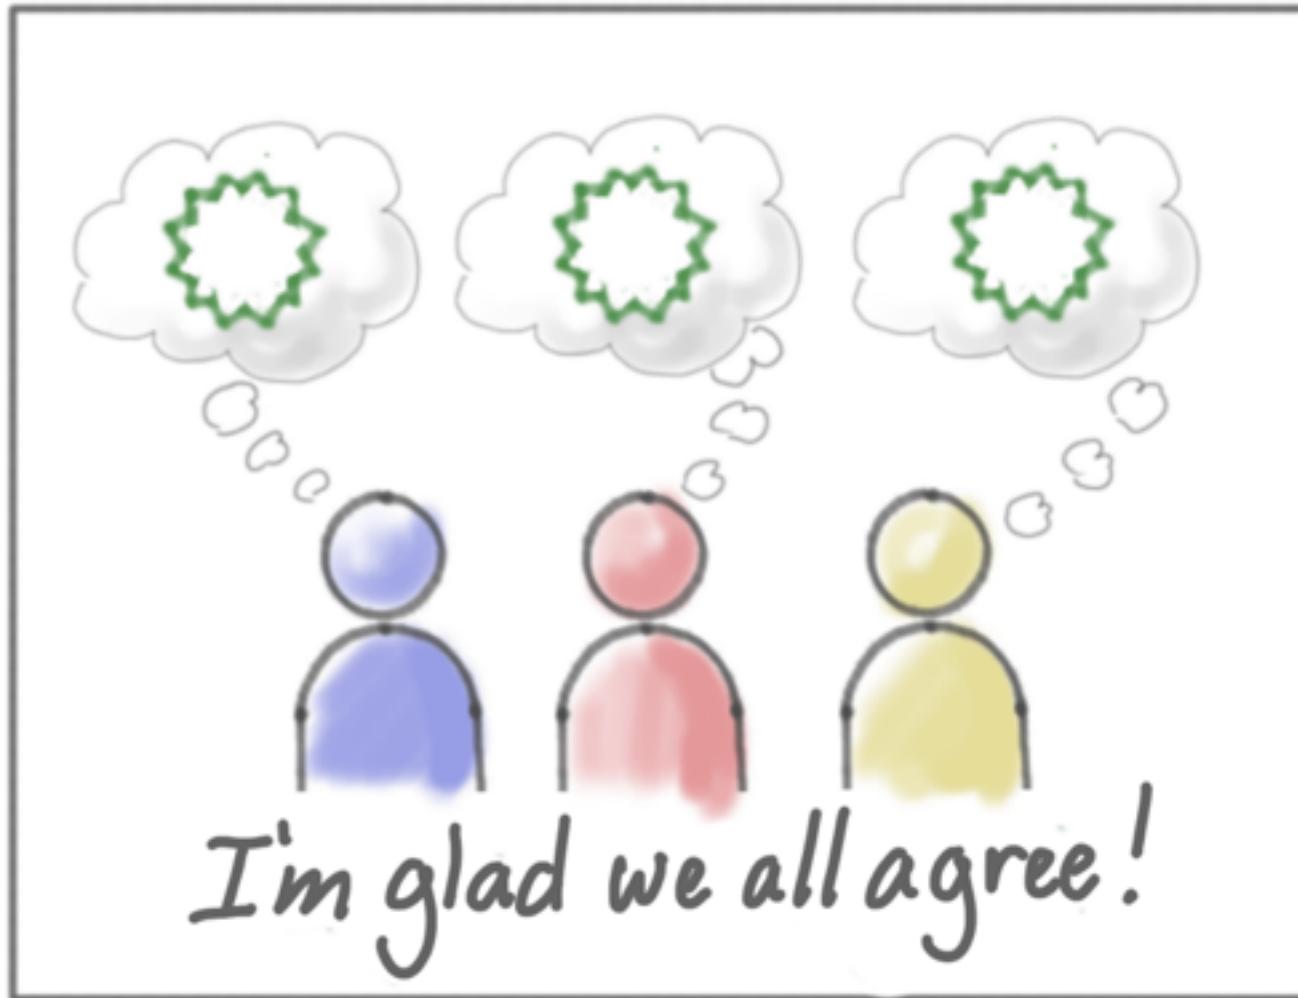

# When we externalize our thinking with words and pictures, we detect differences

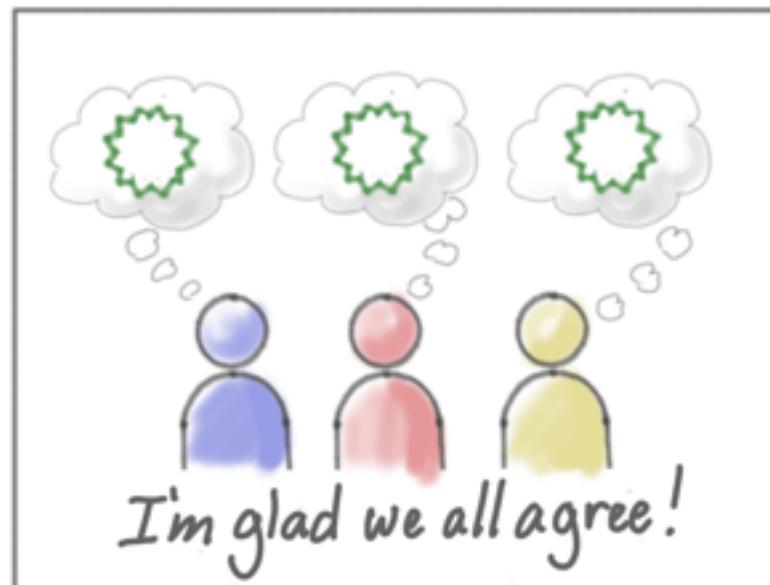

# When we combine and refine, we arrive at something better

Afterwards, when we say the same thing, we actually mean it

# Shared understanding and alignment are the objectives of collaborative work

\* Credit for this illustration goes to ThoughtWorks' Luke Barret. Jeff Patton drew these illustrations based on Luke's. Luke doesn't recall where he first saw this cartoon.

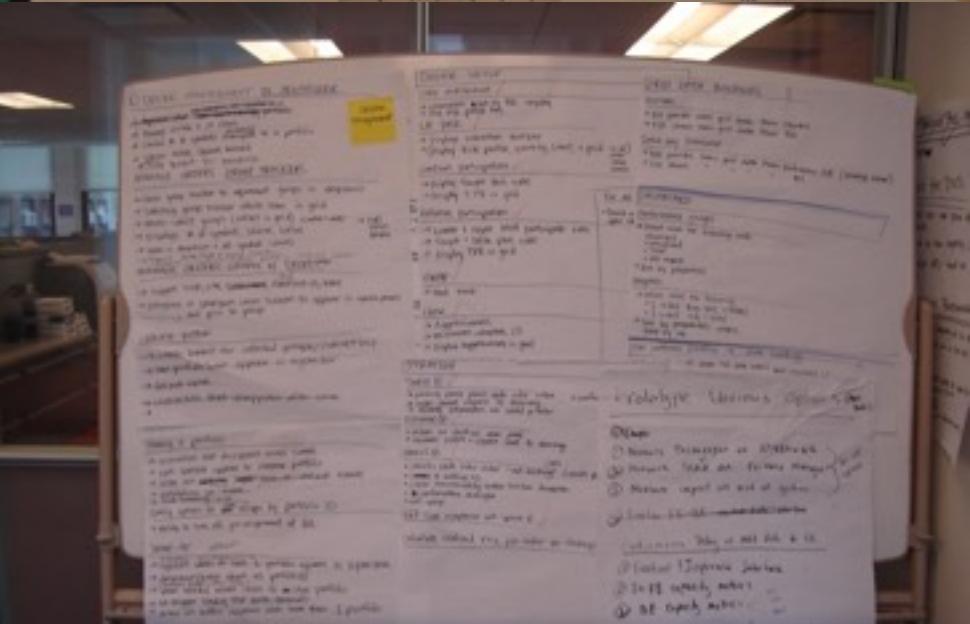

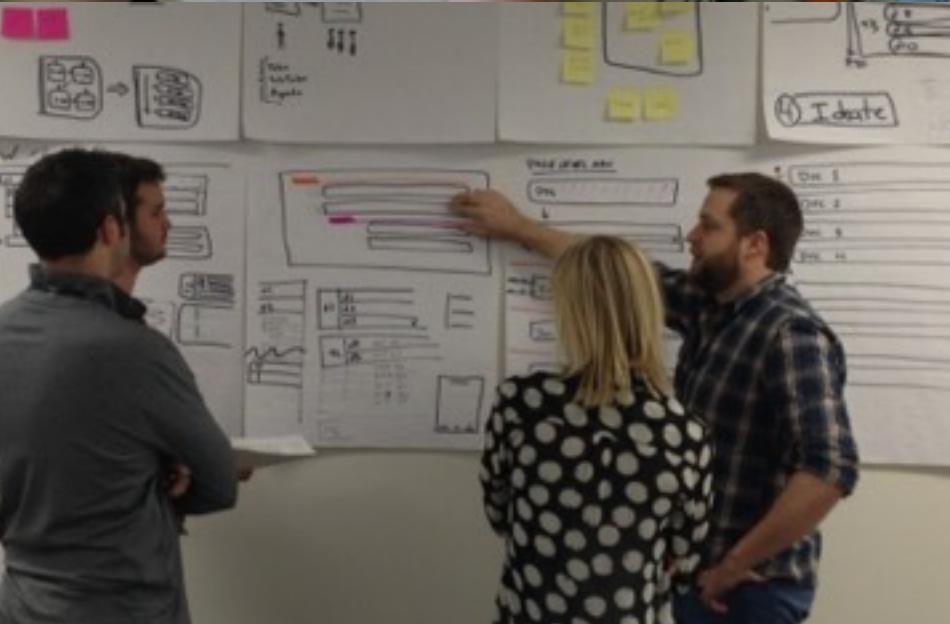

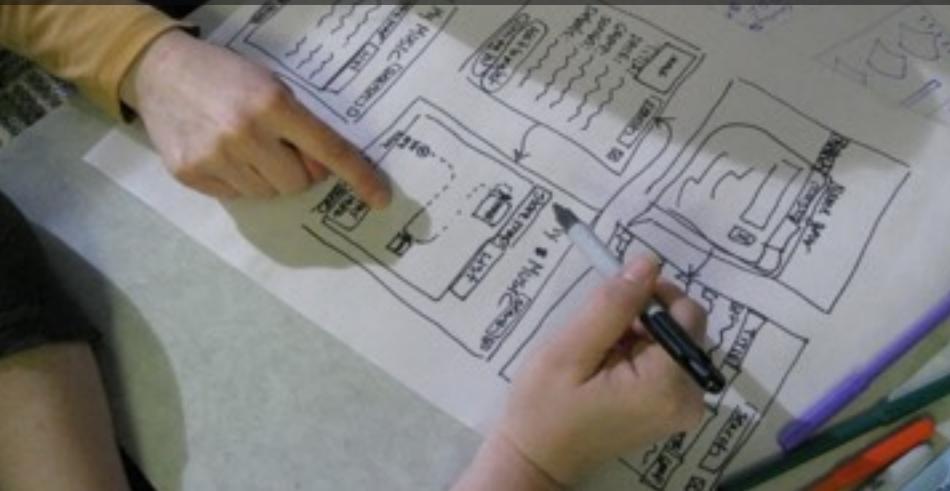

Shared documents  
aren't shared  
understanding

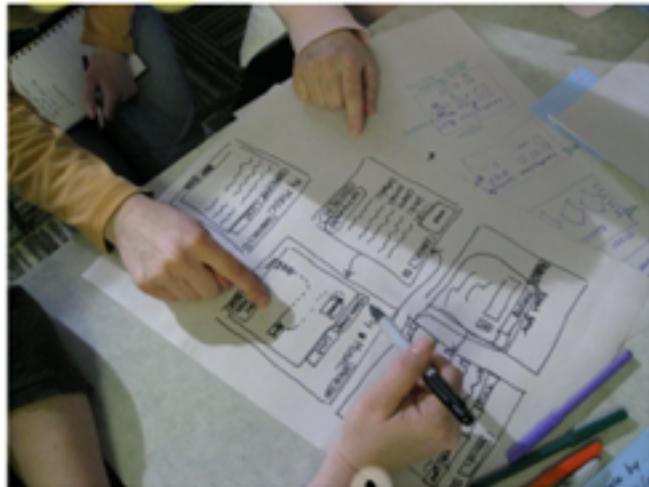

# Words, pictures, and discussion help everyone build shared understanding

# To build shared understanding, use sketching and recording on walls and whiteboards

# Use words and pictures

sketch,  
tell stories,  
write down  
facts & decisions

# Shared Understanding and collaboration at Atlassian

# Shared Understanding and collaboration at Atlassian

# A different kind of stand-up meeting at Atlassian

# What you record during conversations works like a vacation photo

Looking at it helps you remember details that aren't in the photo

# What you record during conversations works like a vacation photo

Looking at it helps you remember details that aren't in the photo

# Effective story conversations **build shared understanding**

The best **documents** use words  
and pictures to **help recall our**  
**conversations**, they don't replace  
conversations

Stories are meant to solve 2 problems:

1. Building shared-understanding through story telling

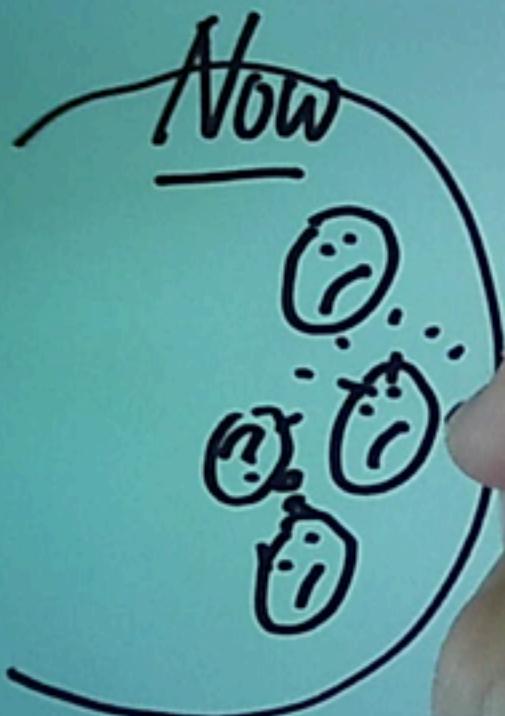

Your job isn't really  
to build software

# Stories are an antidote to “requirements”

Software development has been steered wrong by the word ‘requirement,’ defined in the dictionary as “something mandatory or obligatory.”

The word carries a connotation of absolutism and permanence, inhibitors to embracing change. And the word ‘requirement’ is just plain wrong.

Plan using units of change, not requirements. Change the traffic with the same response times. Encourage users to dial frequently used numbers. Encourage users to self-configure their own systems. Encourage users to estimate the development effort necessary to implement it.

Software development has been steered wrong by the word “requirement”, defined in the dictionary as “something mandatory or obligatory.” The word carries a connotation of absolutism and permanence, inhibitors to embracing change. And the word “requirement” is just plain wrong. Out of one thousand pages of “requirements”, if you deploy a system with the right 20% or 10% or even 5%, you will likely miss all of the business benefit envisioned for the whole system. So what’s the problem? Requirements are “the right 20% of the requirements”; they weren’t really requirements at all.

Kent suggested we  
talk about what  
happens when things  
come out

# Talk about who does what, and why

What I was thinking  
of was the way users sometimes  
tell stories about the cool new things the  
software they use does:

*“I type in the zip code and it  
automatically fills in the city and state  
without me having to touch a button!”*

I think that was the example that triggered the idea.  
If you can tell stories about what the software does  
and **generate energy and interest and a vision in  
your listener's mind**, then why not tell  
stories before the software does it?

Focus discussion and collaboration around who will use the product and what they'll do later, after delivery

You'll have to think  
things through

# This is a cake for a baby shower

Jen Yates' Cake Wrecks: [www.cakewrecks.com](http://www.cakewrecks.com)

I don't think they  
thought this through...

# This is a cake for a baby shower

Jen Yates' Cake Wrecks: [www.cakewrecks.com](http://www.cakewrecks.com)

Jeff Patton & Associates, [jeff@jpattonassociates.com](mailto:jeff@jpattonassociates.com), [twitter@jeffpatton](https://twitter.com/jeffpatton)

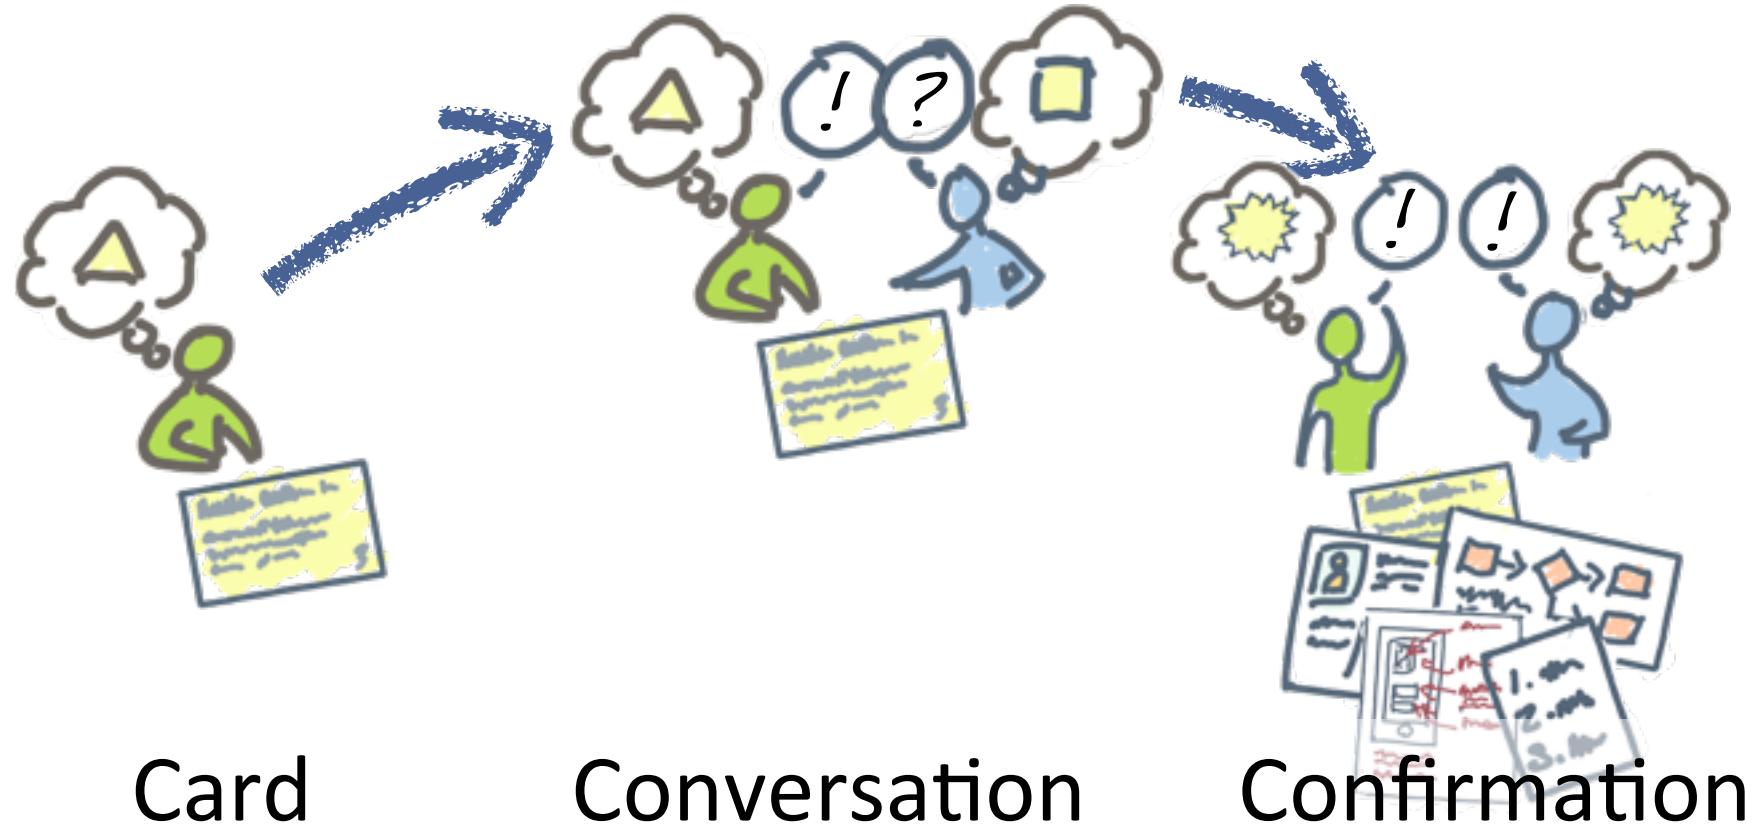

Stories are meant to solve 2 problems:

1. Building shared-understanding through story telling
2. Minimizing output, maximizing outcome and impact

Stories aren't a  
different way to write  
requirements, they're  
a different way to  
work

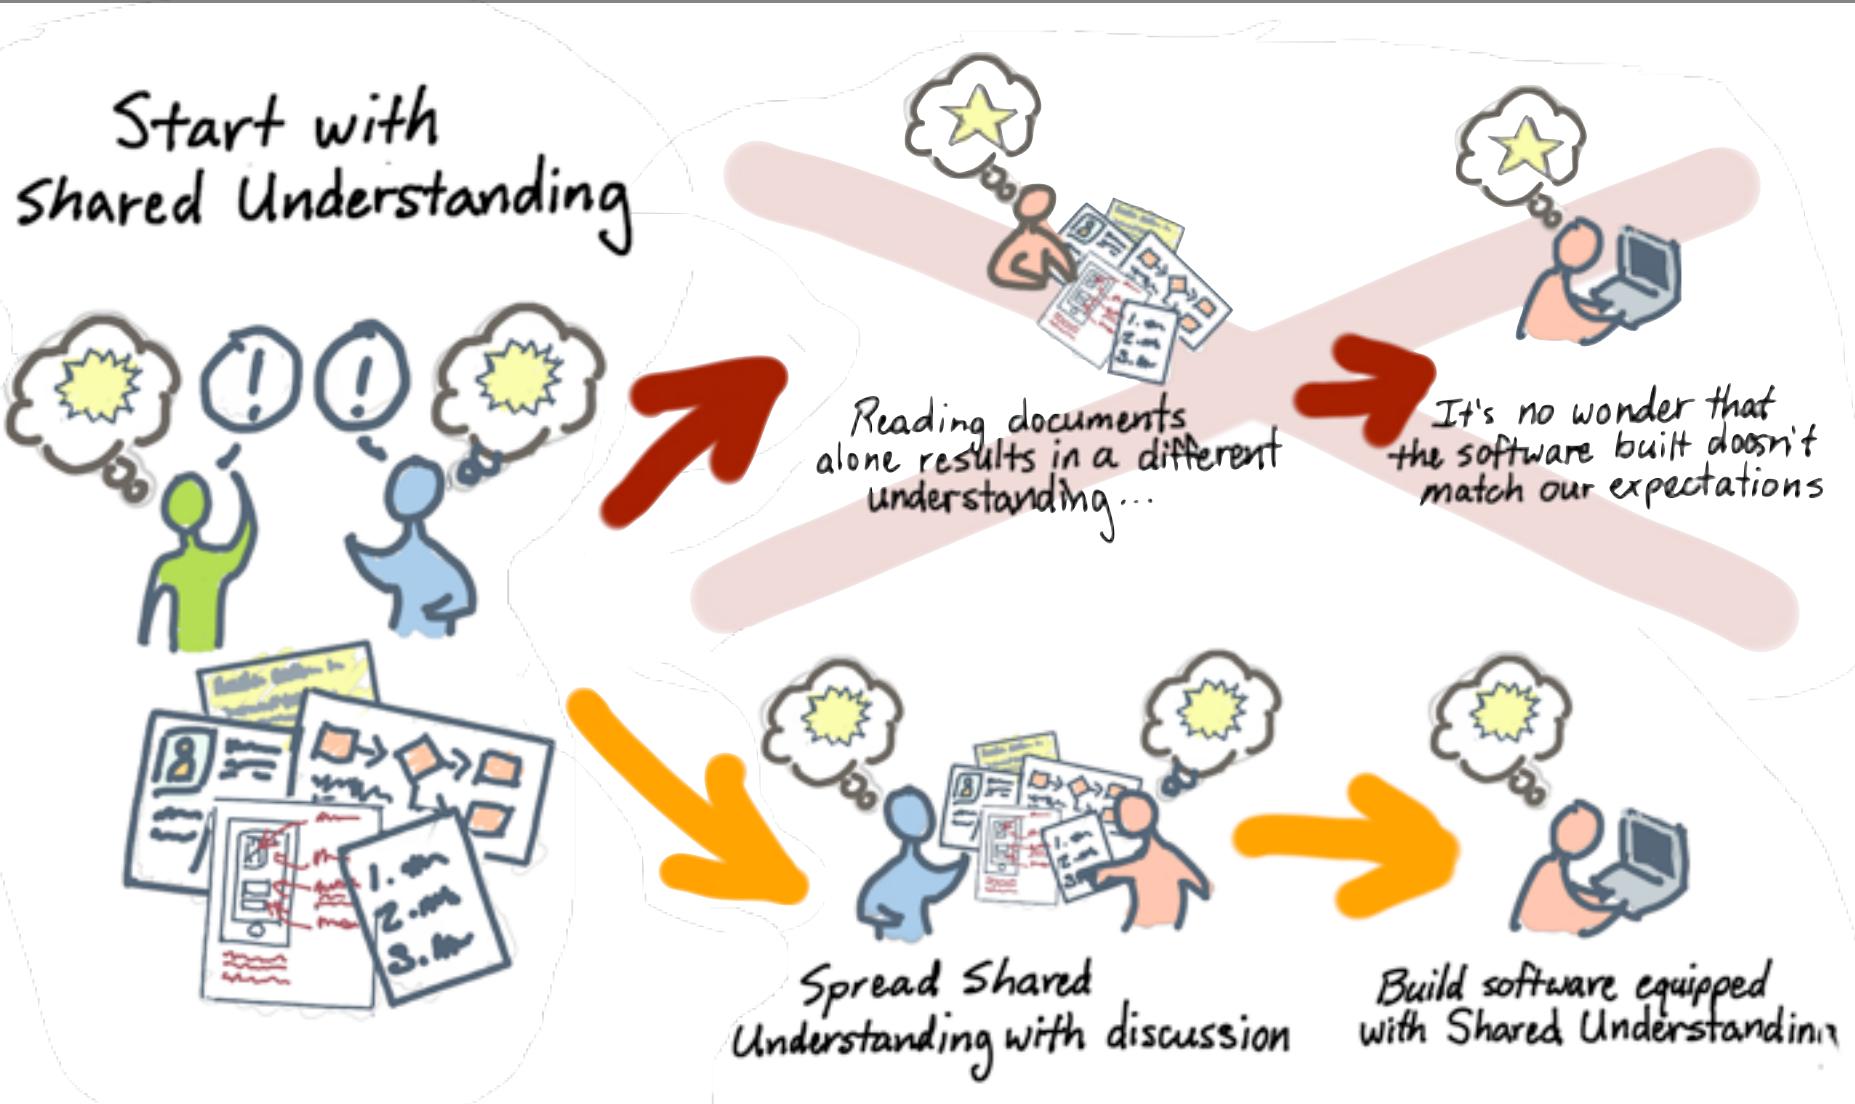

# Stories have a simple lifecycle

\* Ron Jeffries coined the 3 C's in  
Extreme Programming Installed

# If you replace a conversation with a document, you've stopped using stories

# If you replace a conversation with a document, you've stopped using stories

© 2003 United Feature Syndicate <http://dilbert.com/strip/2003-09-25>

# If you replace a conversation with a document, you've stopped using stories

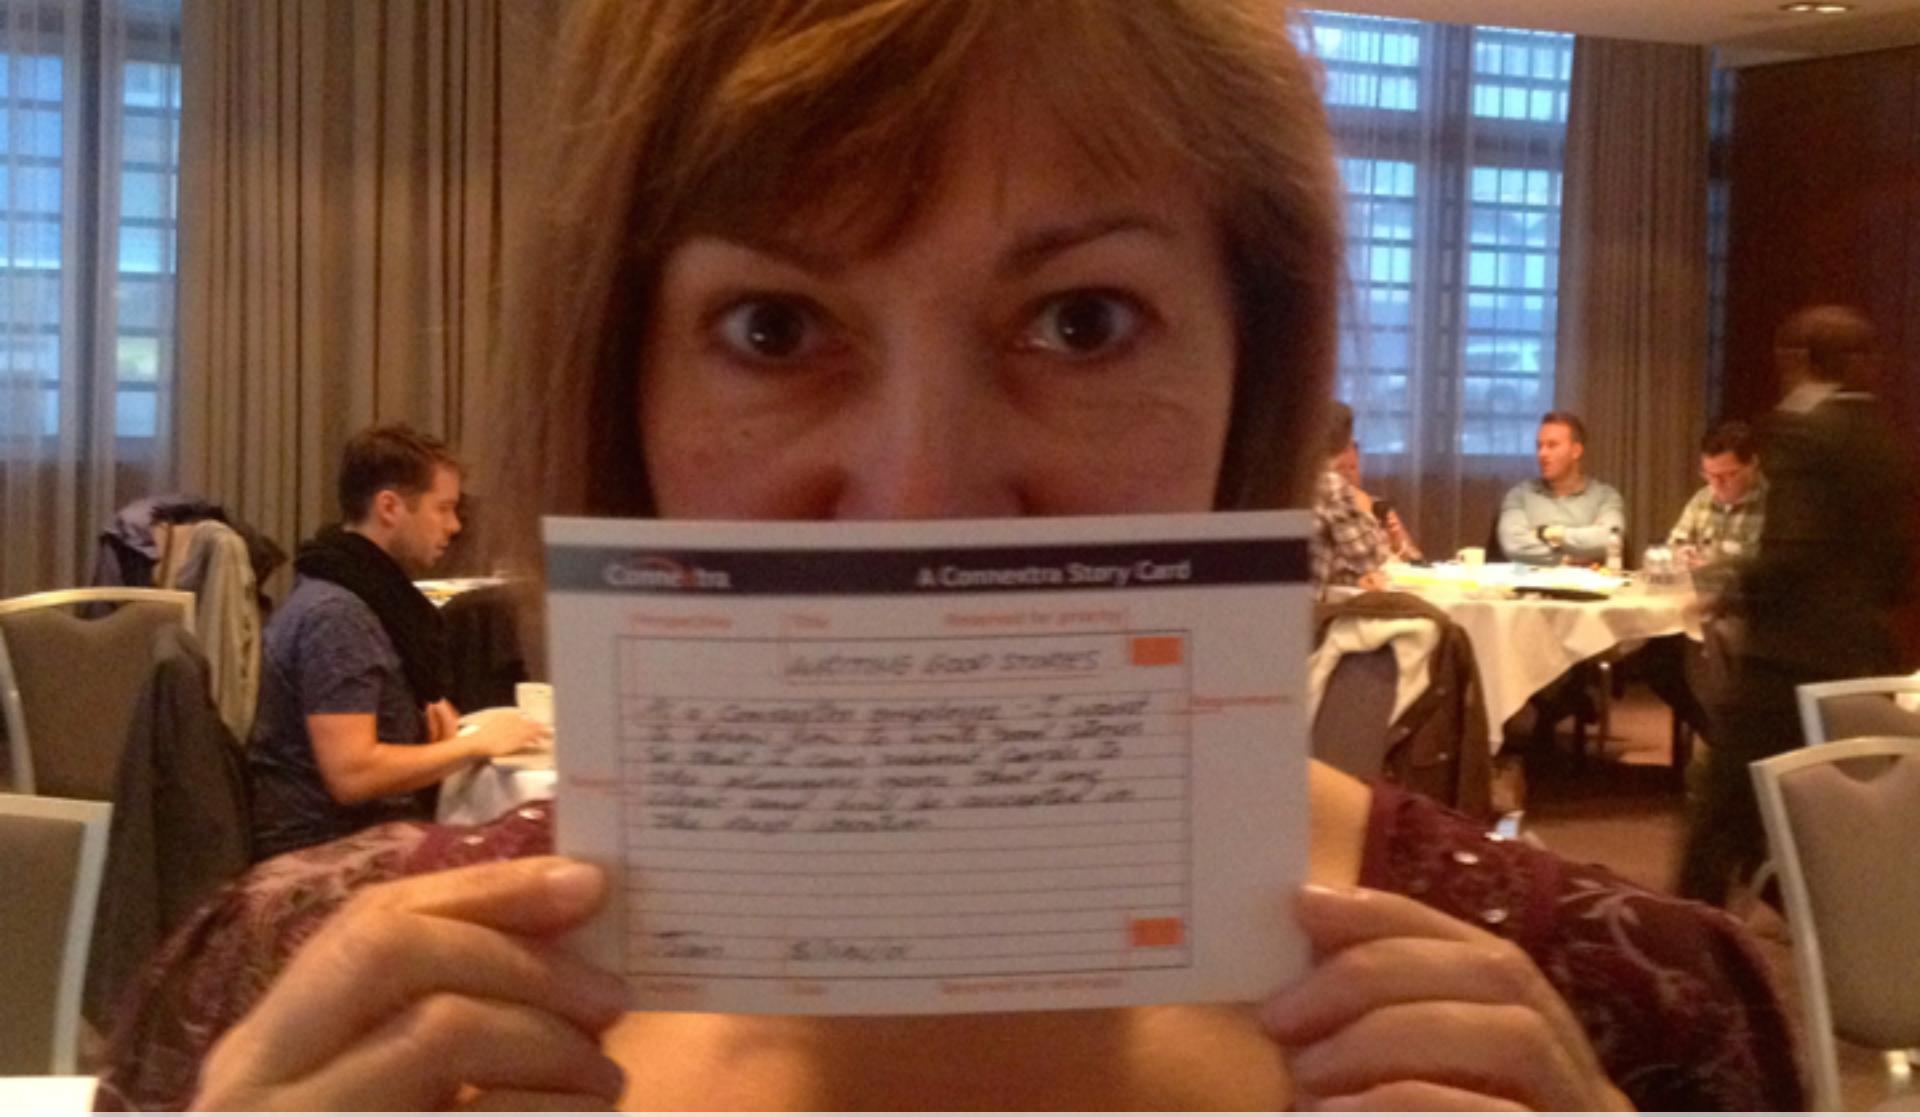

© 2007 Scott Adams, Inc. <http://dilbert.com/strip/2007-11-26>

# A template for starting good conversation and stopping useless conversations

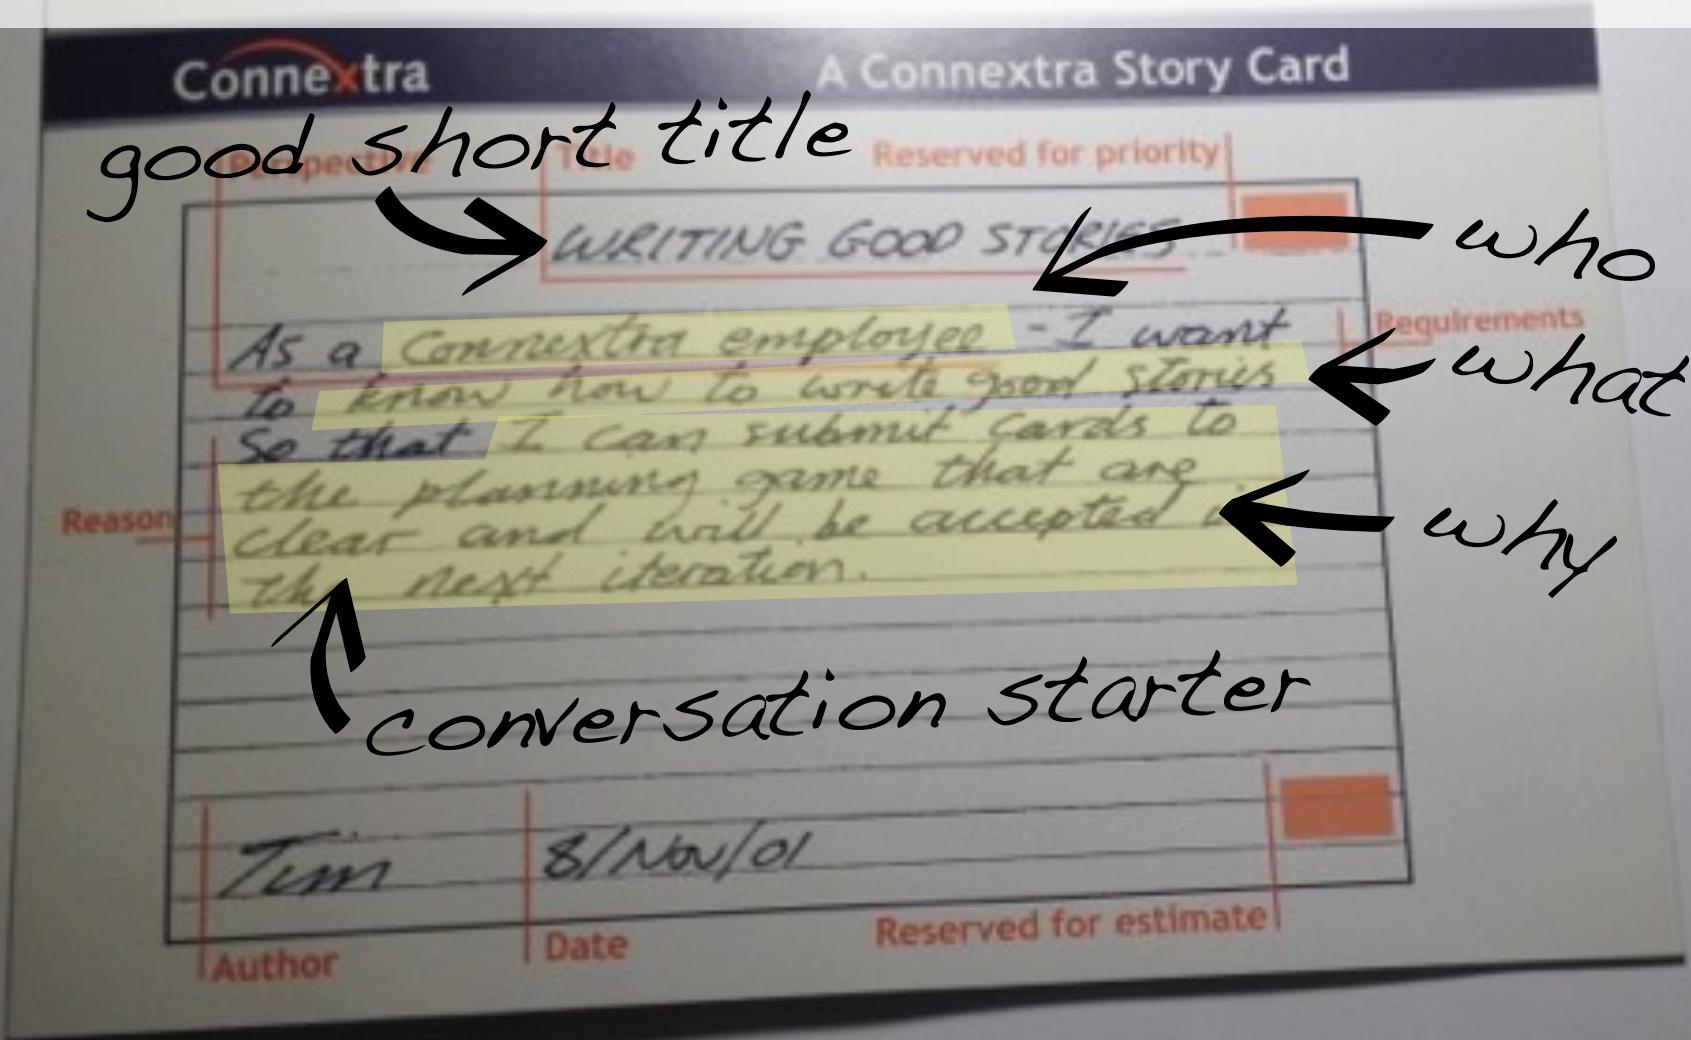

# Say “Hi” to Rachel

# Rachel and her team at Connextra created a clever conversation starter

# Really discussing the who's, what's, and why's goes beyond the simple template

**Who** are the users and what benefit do they get?

- Discuss many possible users.
- Discuss stakeholders and others that may not directly use the software.
- Discuss elements of the system, or services

**What** will users do in the future using your software?

- Discuss what users will do with the feature or changes being
- Discuss what the system will do, especially if we're talking about a backend service

**Why** should your organization build the software?

- Discuss who benefits - it may not be the user
- Discuss why users would benefit
- Discuss why the organization would benefit

Keep what's on the card, or  
in the backlog simple

Use story cards to reference  
all the information discussed  
during conversations

# A better way to build a backlog

# Build story maps in small collaborative groups

# Use the map for continuous discussion

Use story maps to understand  
your whole product or  
feature's experience

Use mapping to break down  
big stories without losing the  
big picture

# A better way to understand users and their challenges

# Discussions drive out more details, validate, and build shared understanding

Talking through the map with multiple users and subject matter experts helps test it for completeness

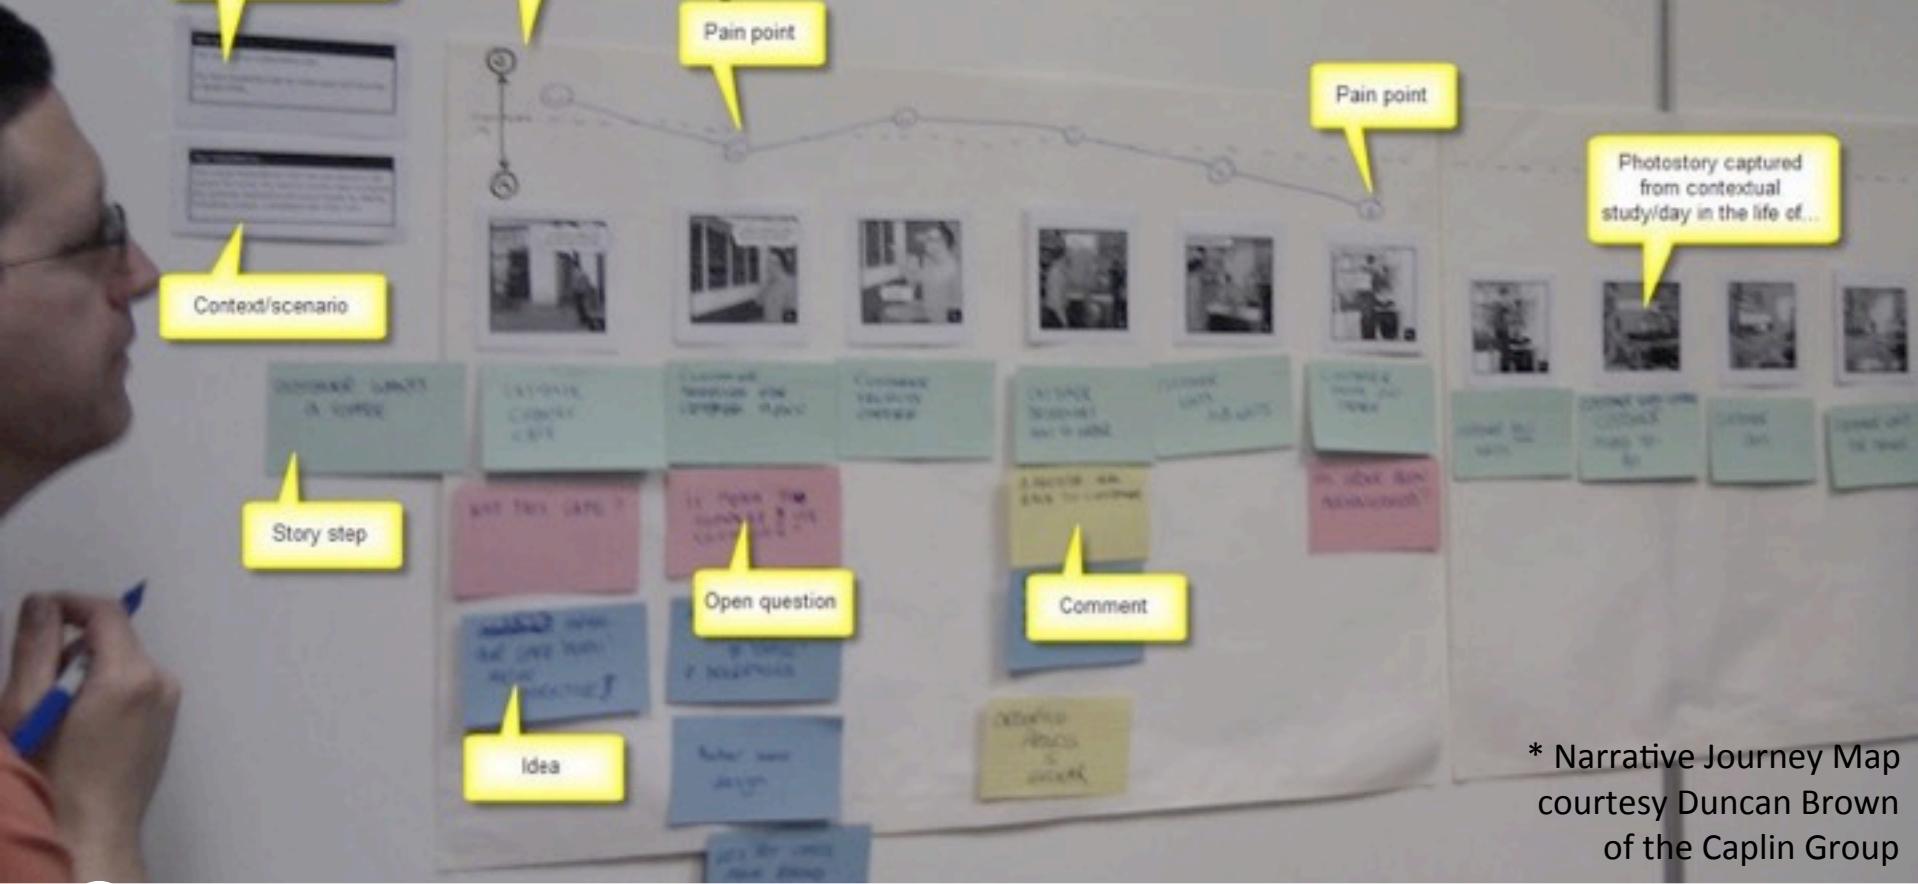

# Journey maps describe the world today

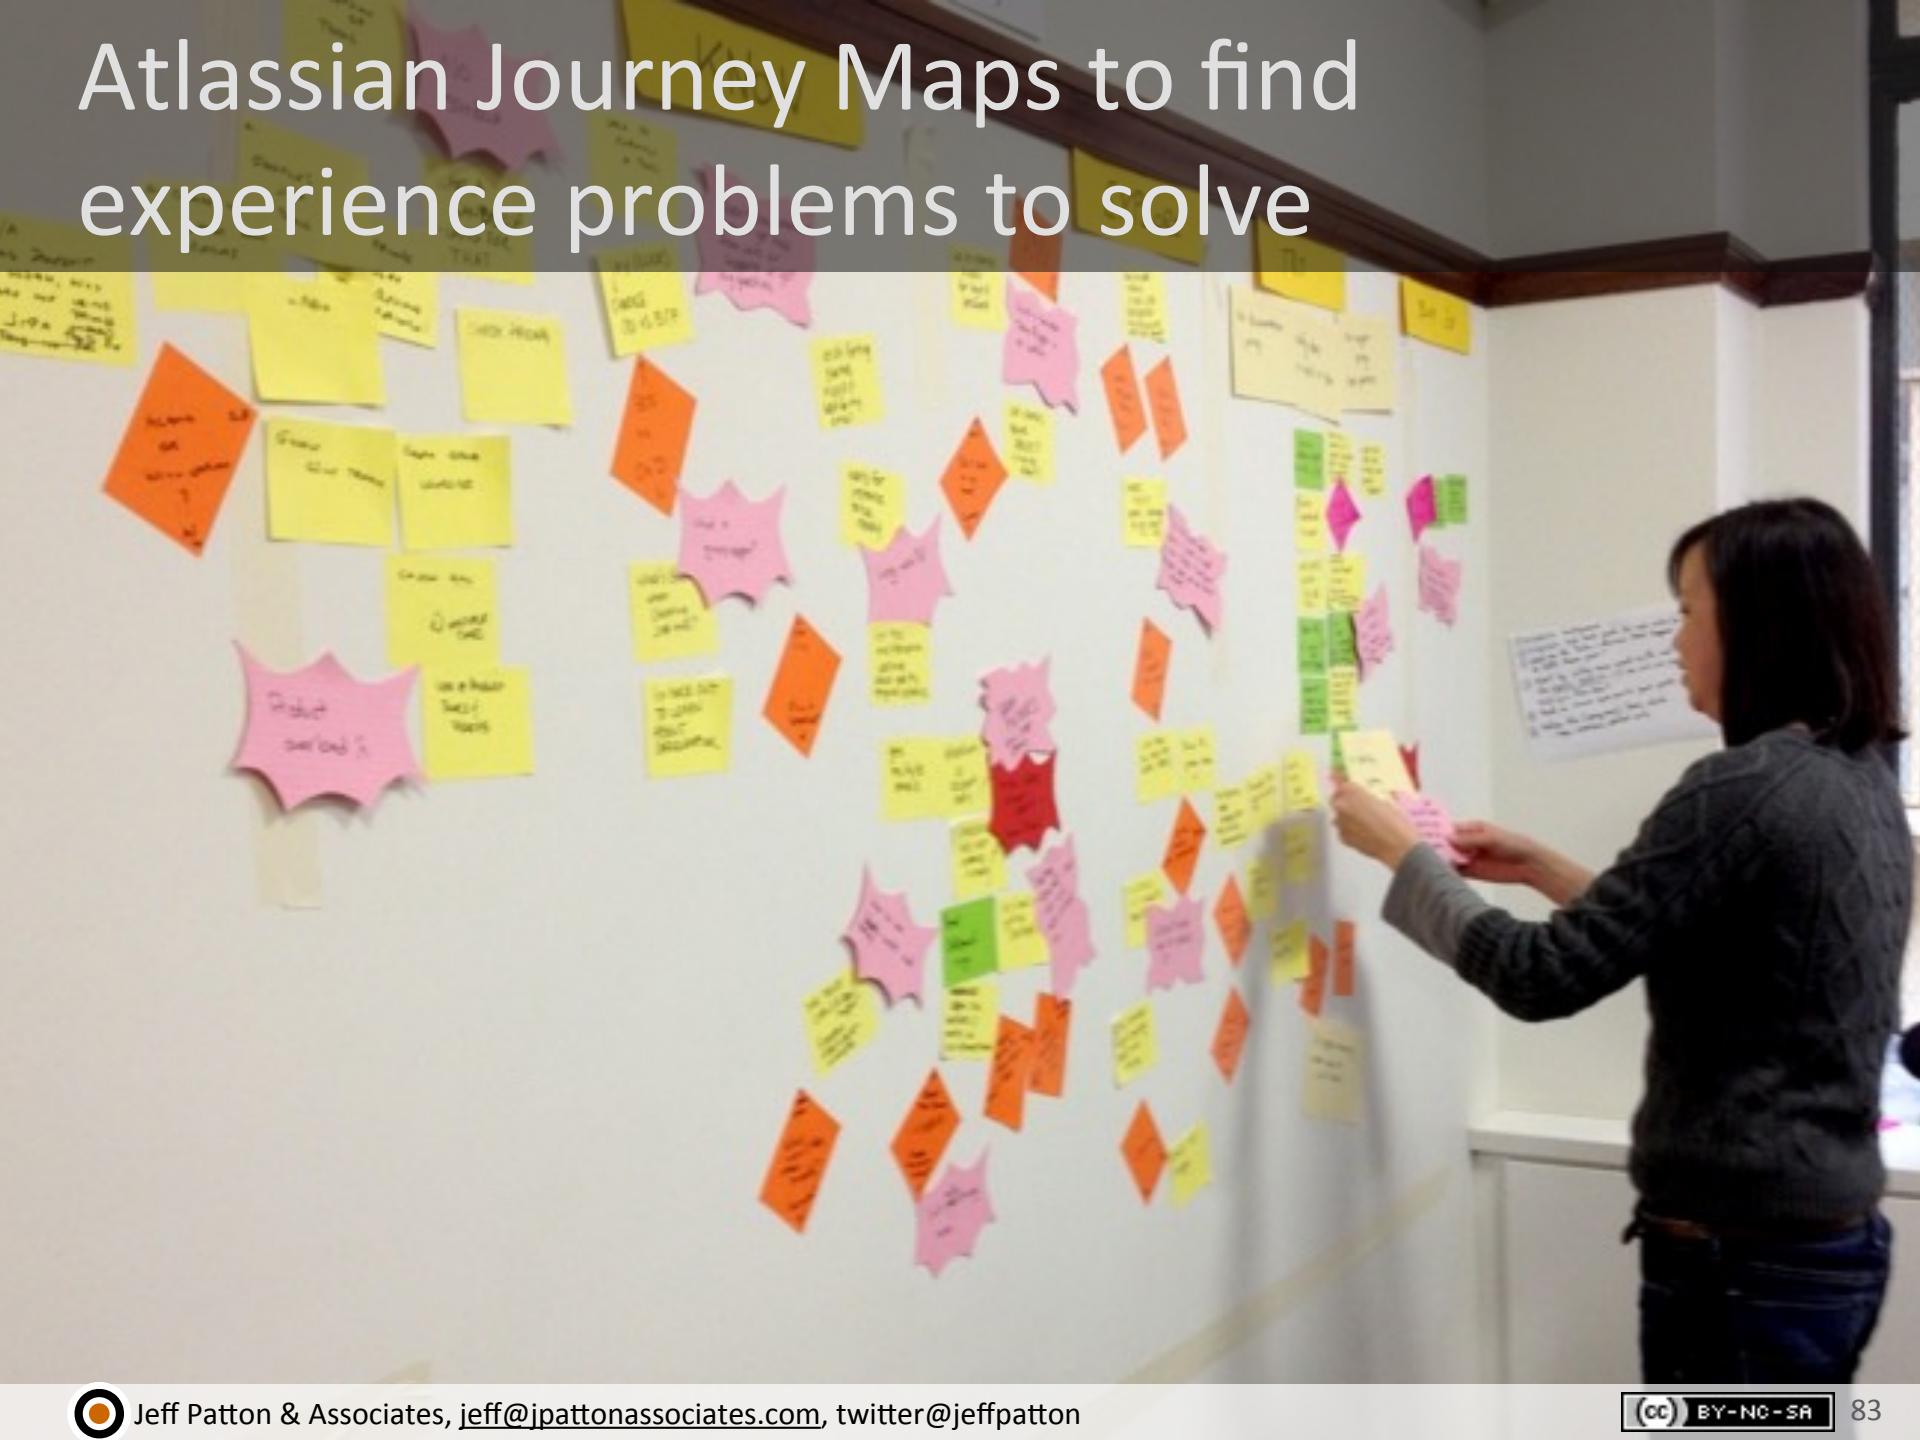

\* Narrative Journey Map  
courtesy Duncan Brown  
of the Caplin Group

# Journey maps describe the world today

# Atlassian Journey Maps to find experience problems to solve

# Atlassian Journey Maps to find experience problems to solve

Use maps to  
understand the way  
people work today,  
and identify options  
for improvement

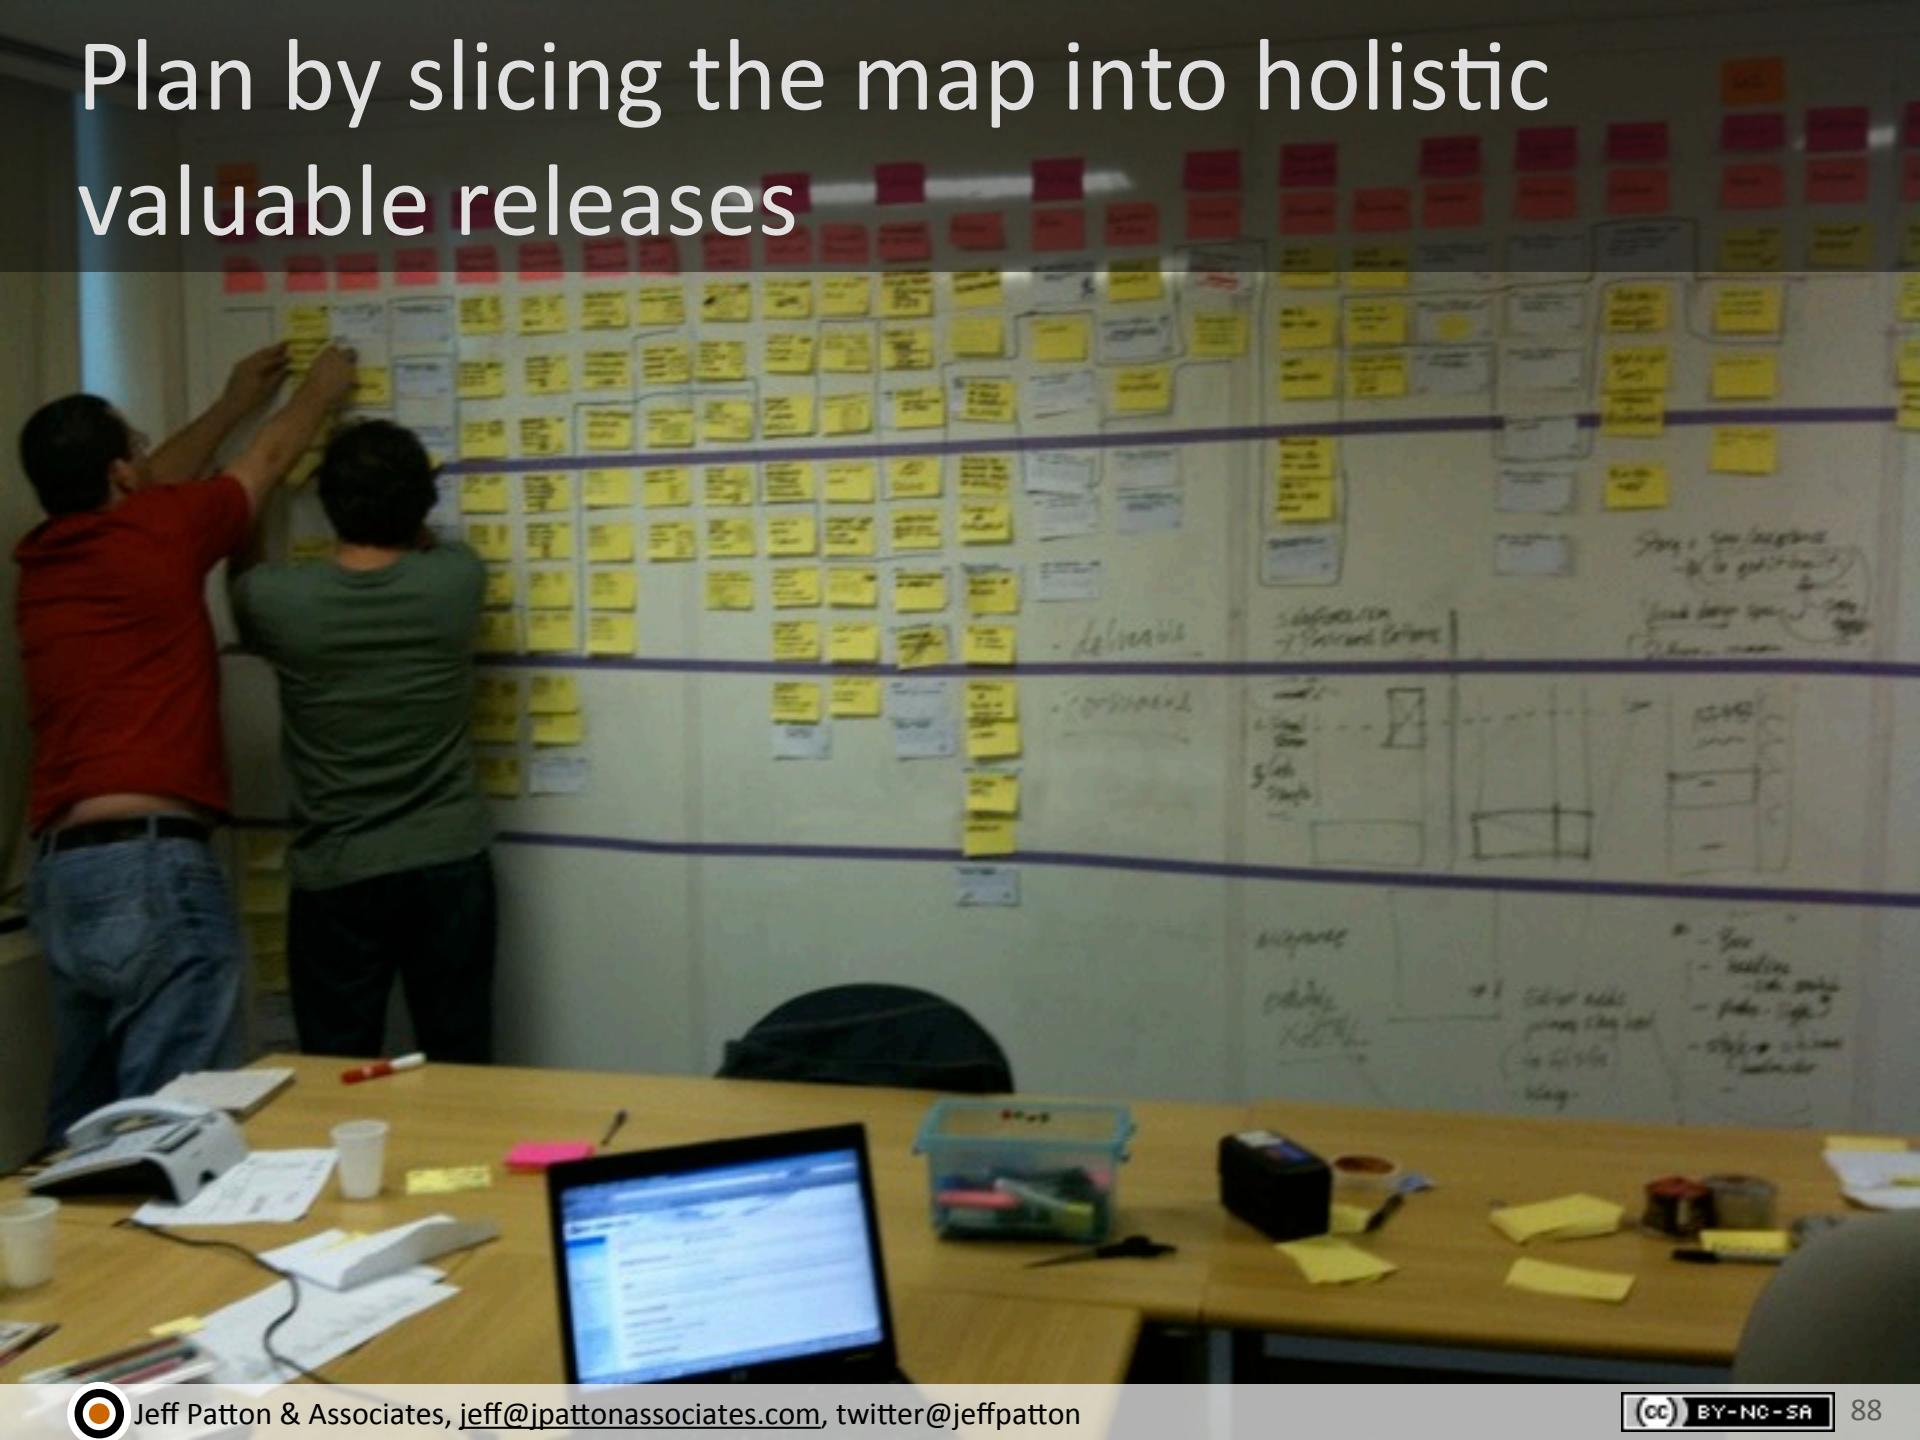

# A better way to find smaller viable releases

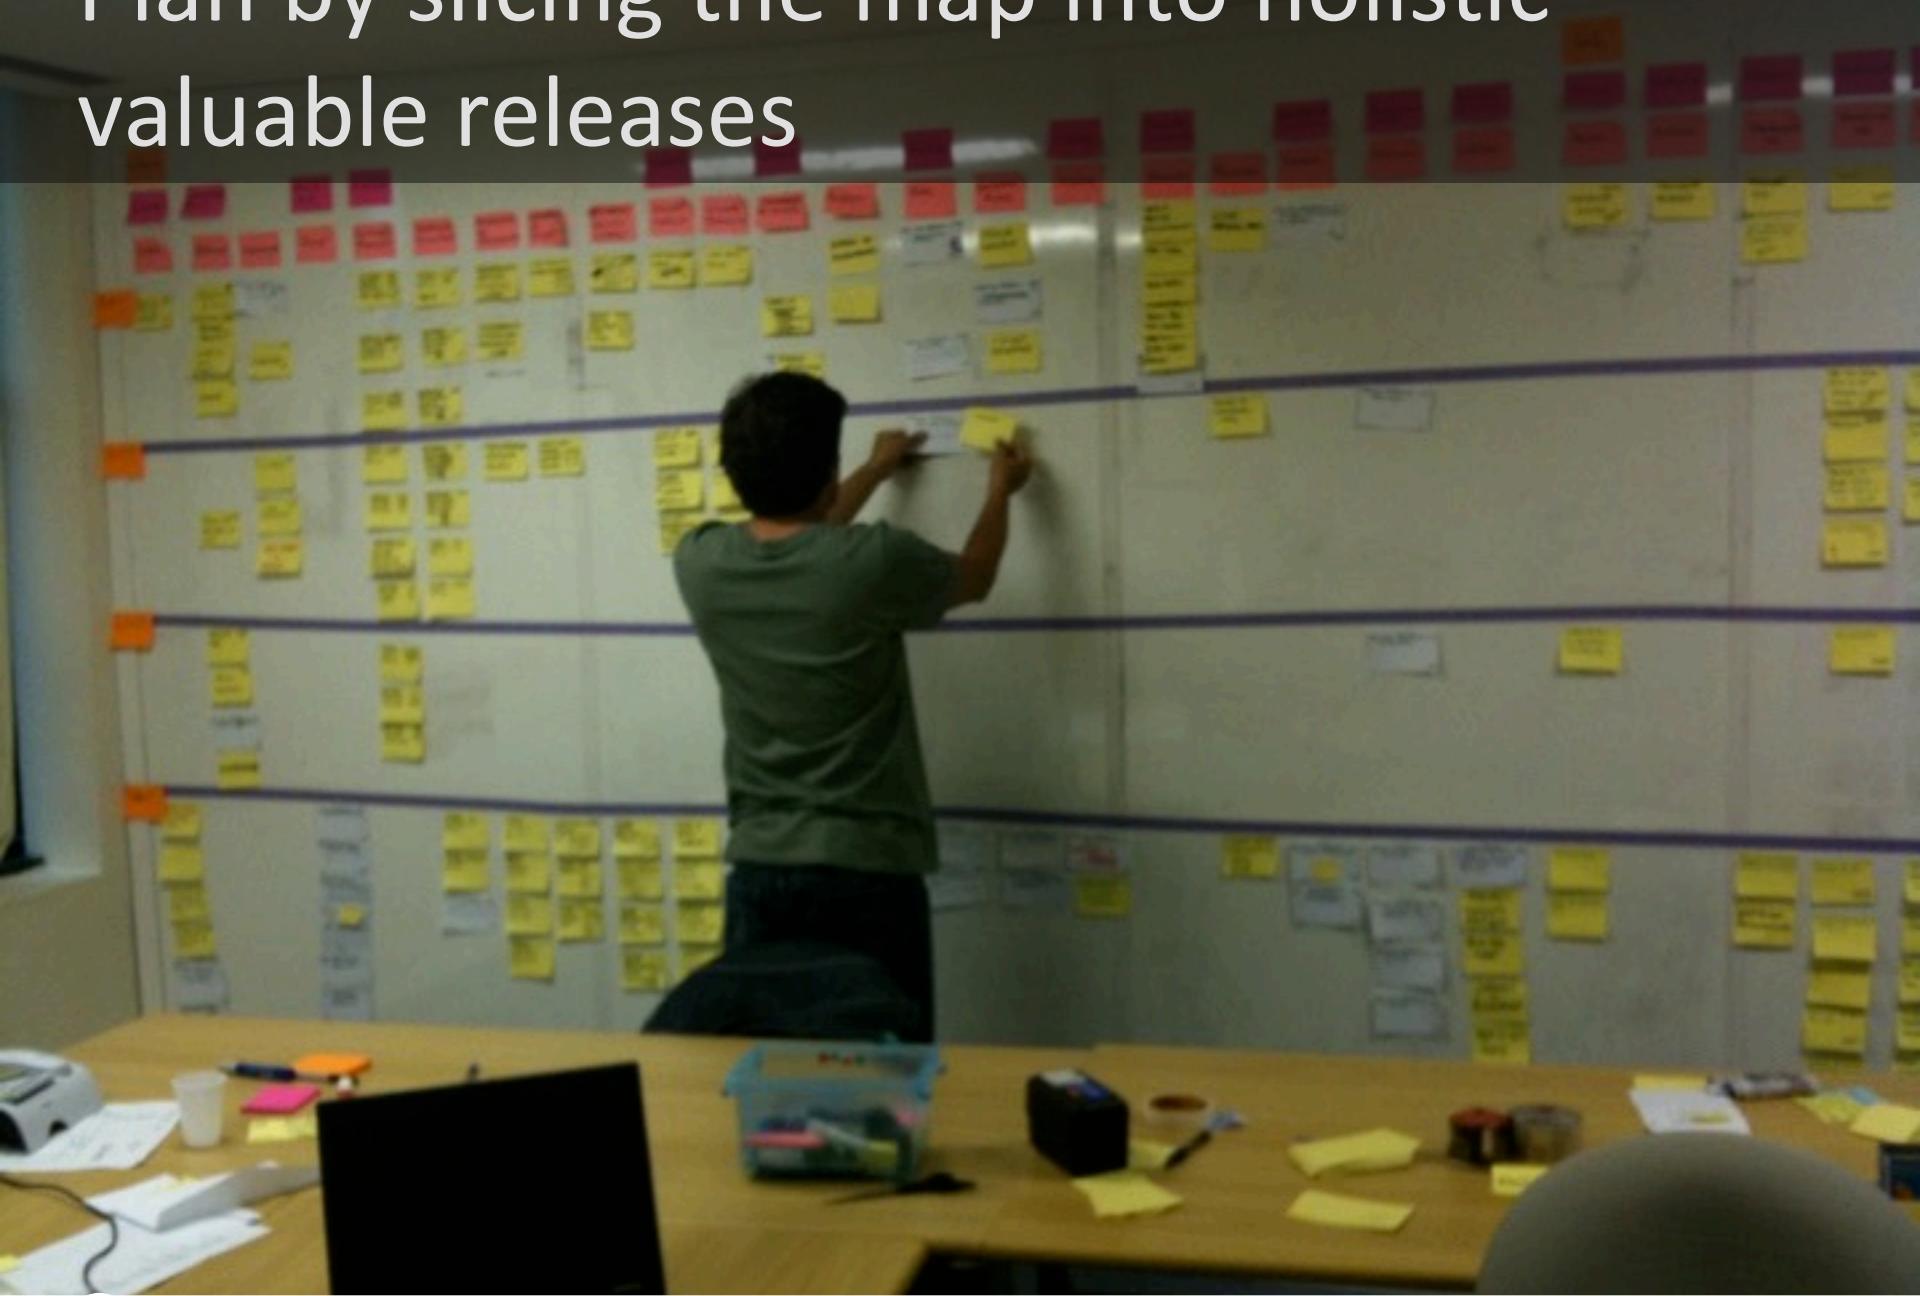

# Plan by slicing the map into holistic valuable releases

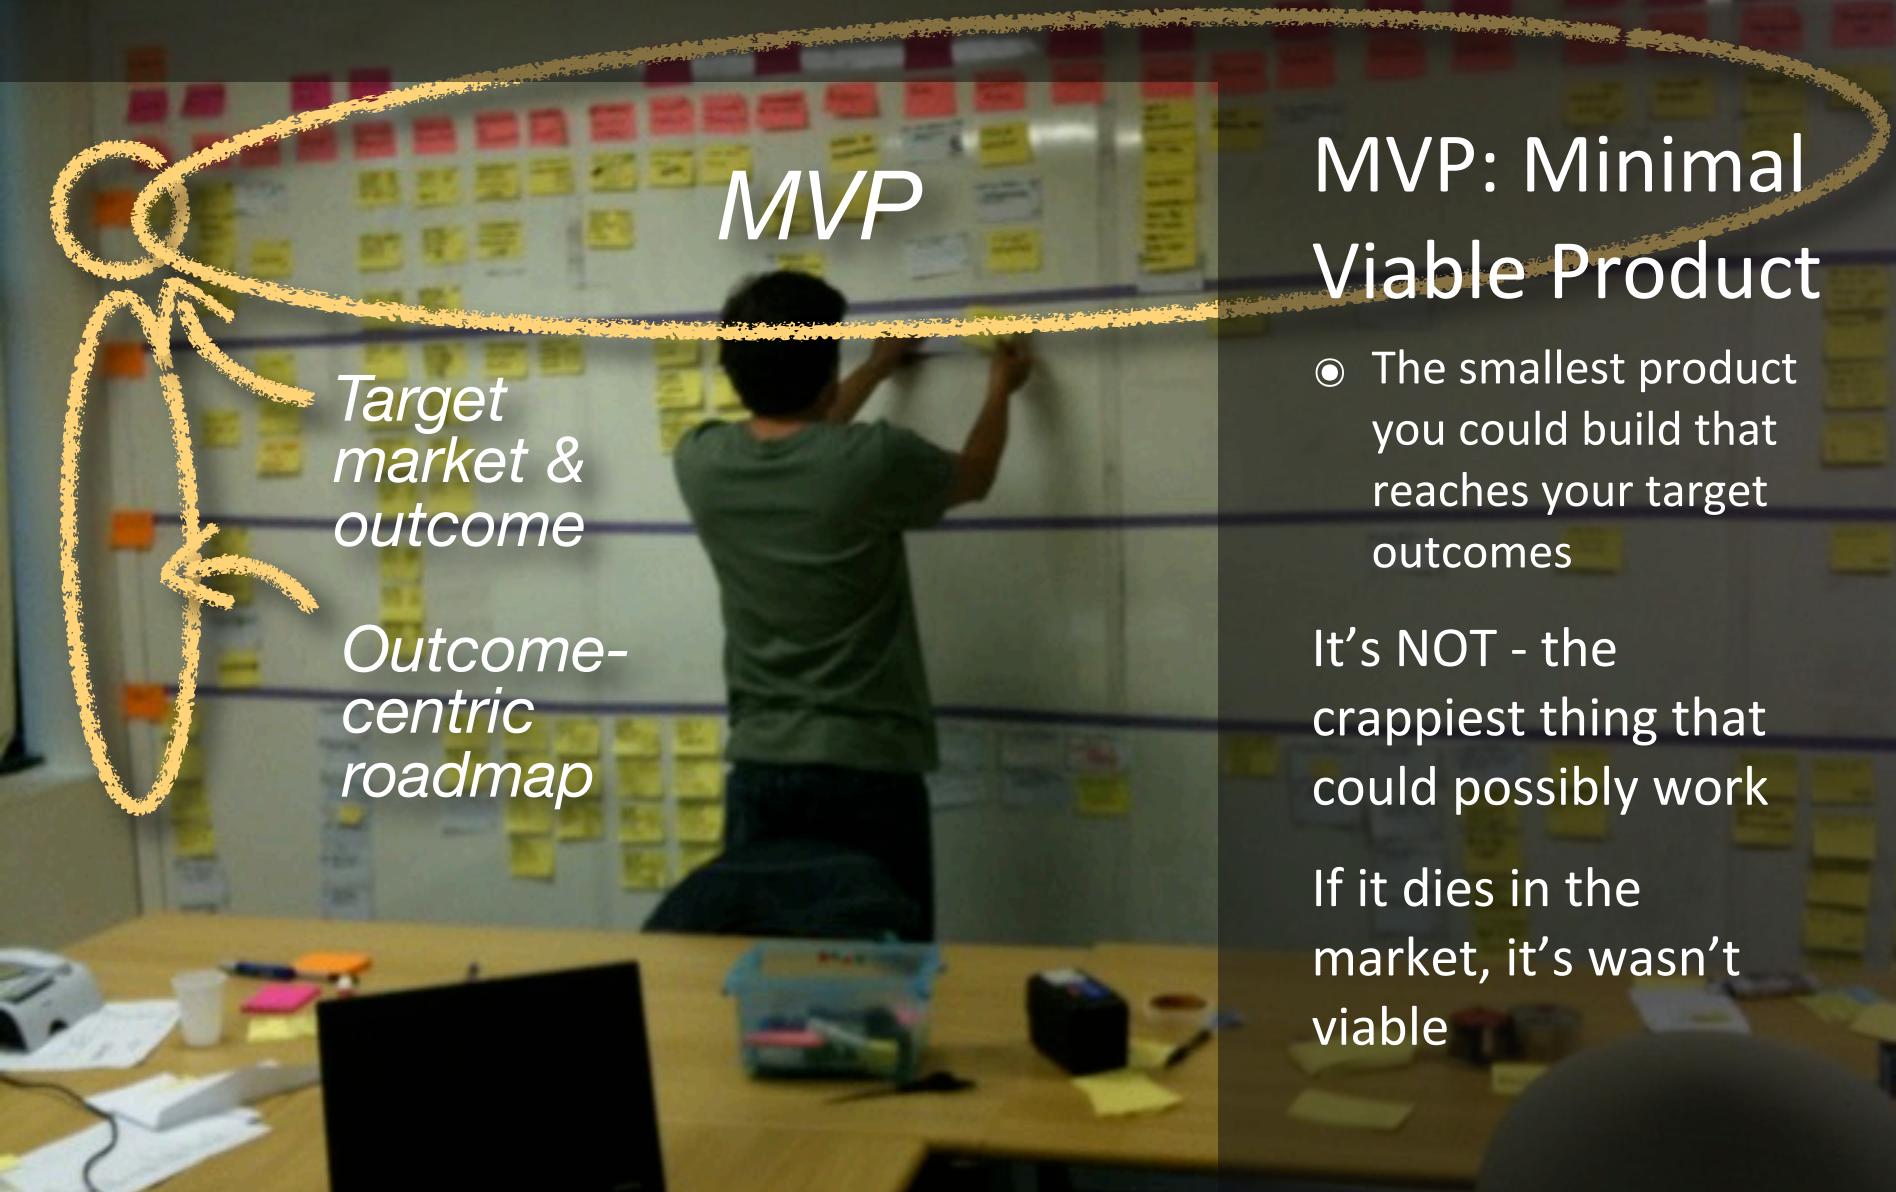

# Plan by slicing the map into holistic valuable releases

# Plan by slicing the map into holistic valuable releases

# Your job is to build LESS software

## MVP: Minimal Viable Product

- The smallest product you could build that reaches your target outcomes

It's NOT - the crappiest thing that could possibly work

If it dies in the market, it's wasn't viable

Use maps to focus  
release strategy on  
specific users and  
outcomes

But, how do you  
know if you're  
hypothesis is correct?

# You don't

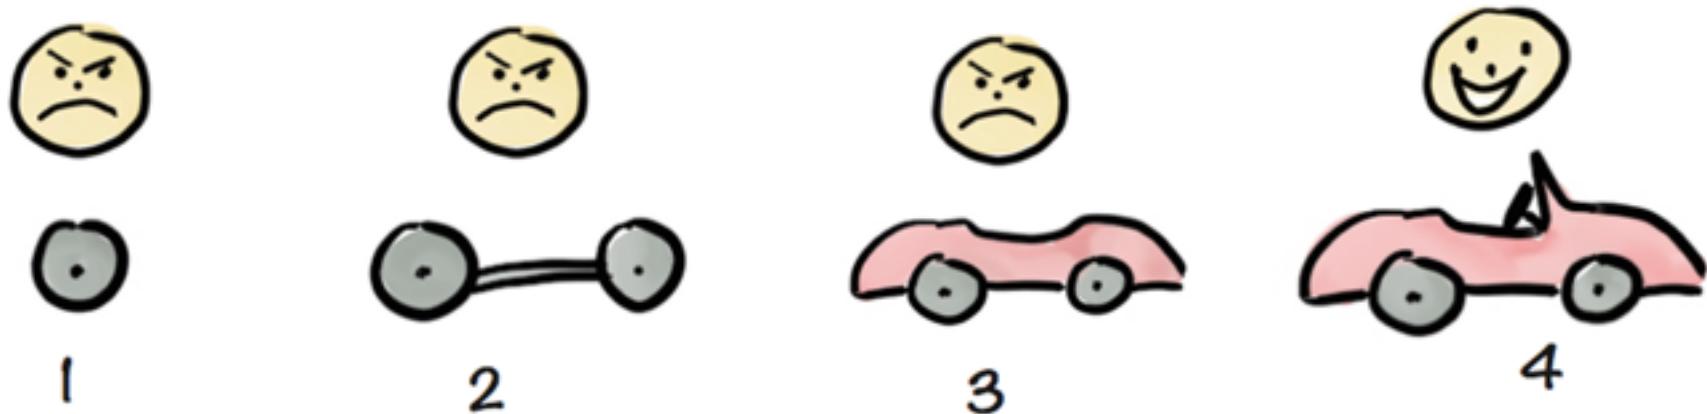

# A better way to test your hypothesis

# Delivering your hypothetical solution a piece at a time delays learning

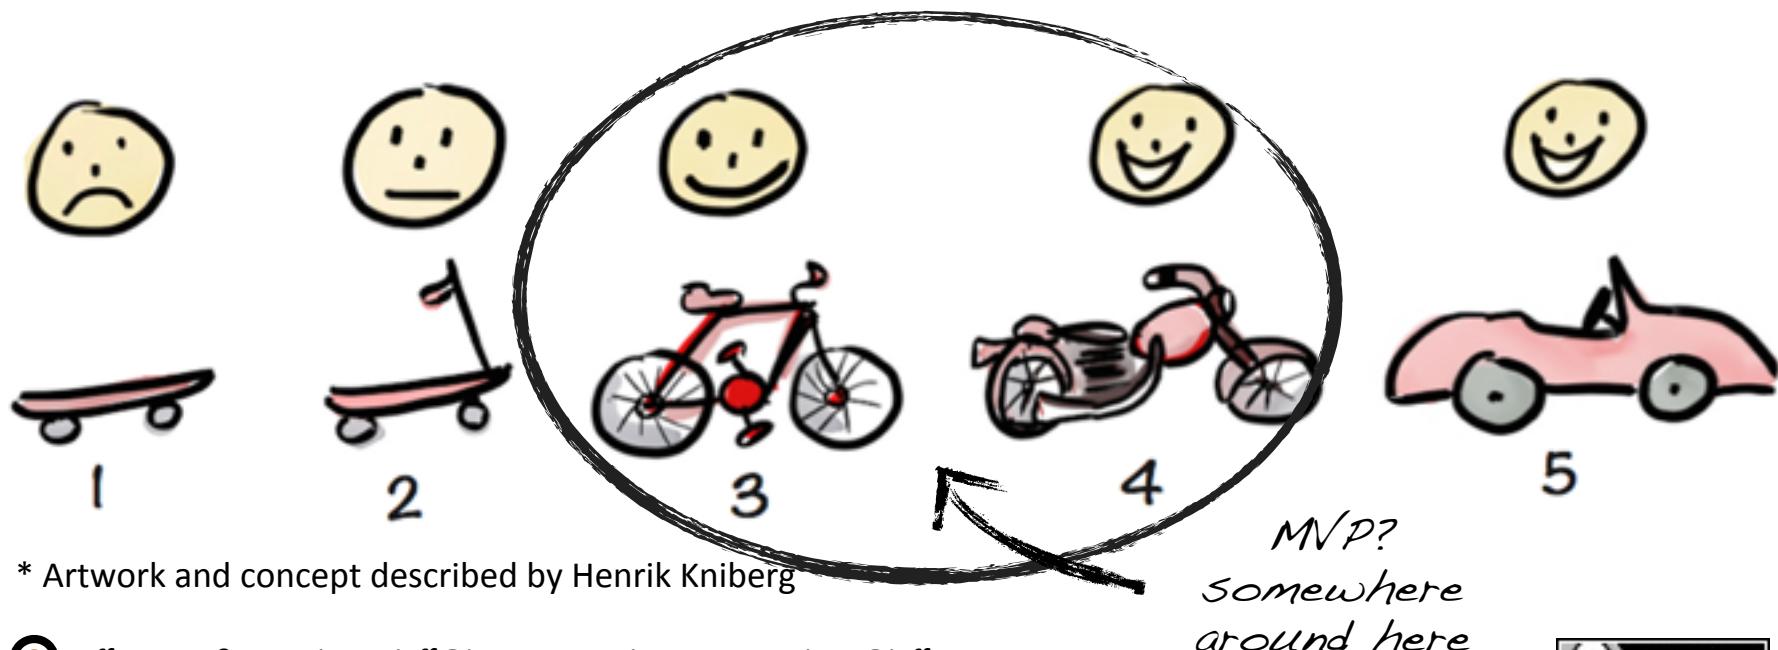

Hypothesis:

\* Artwork and concept described by Henrik Kniberg

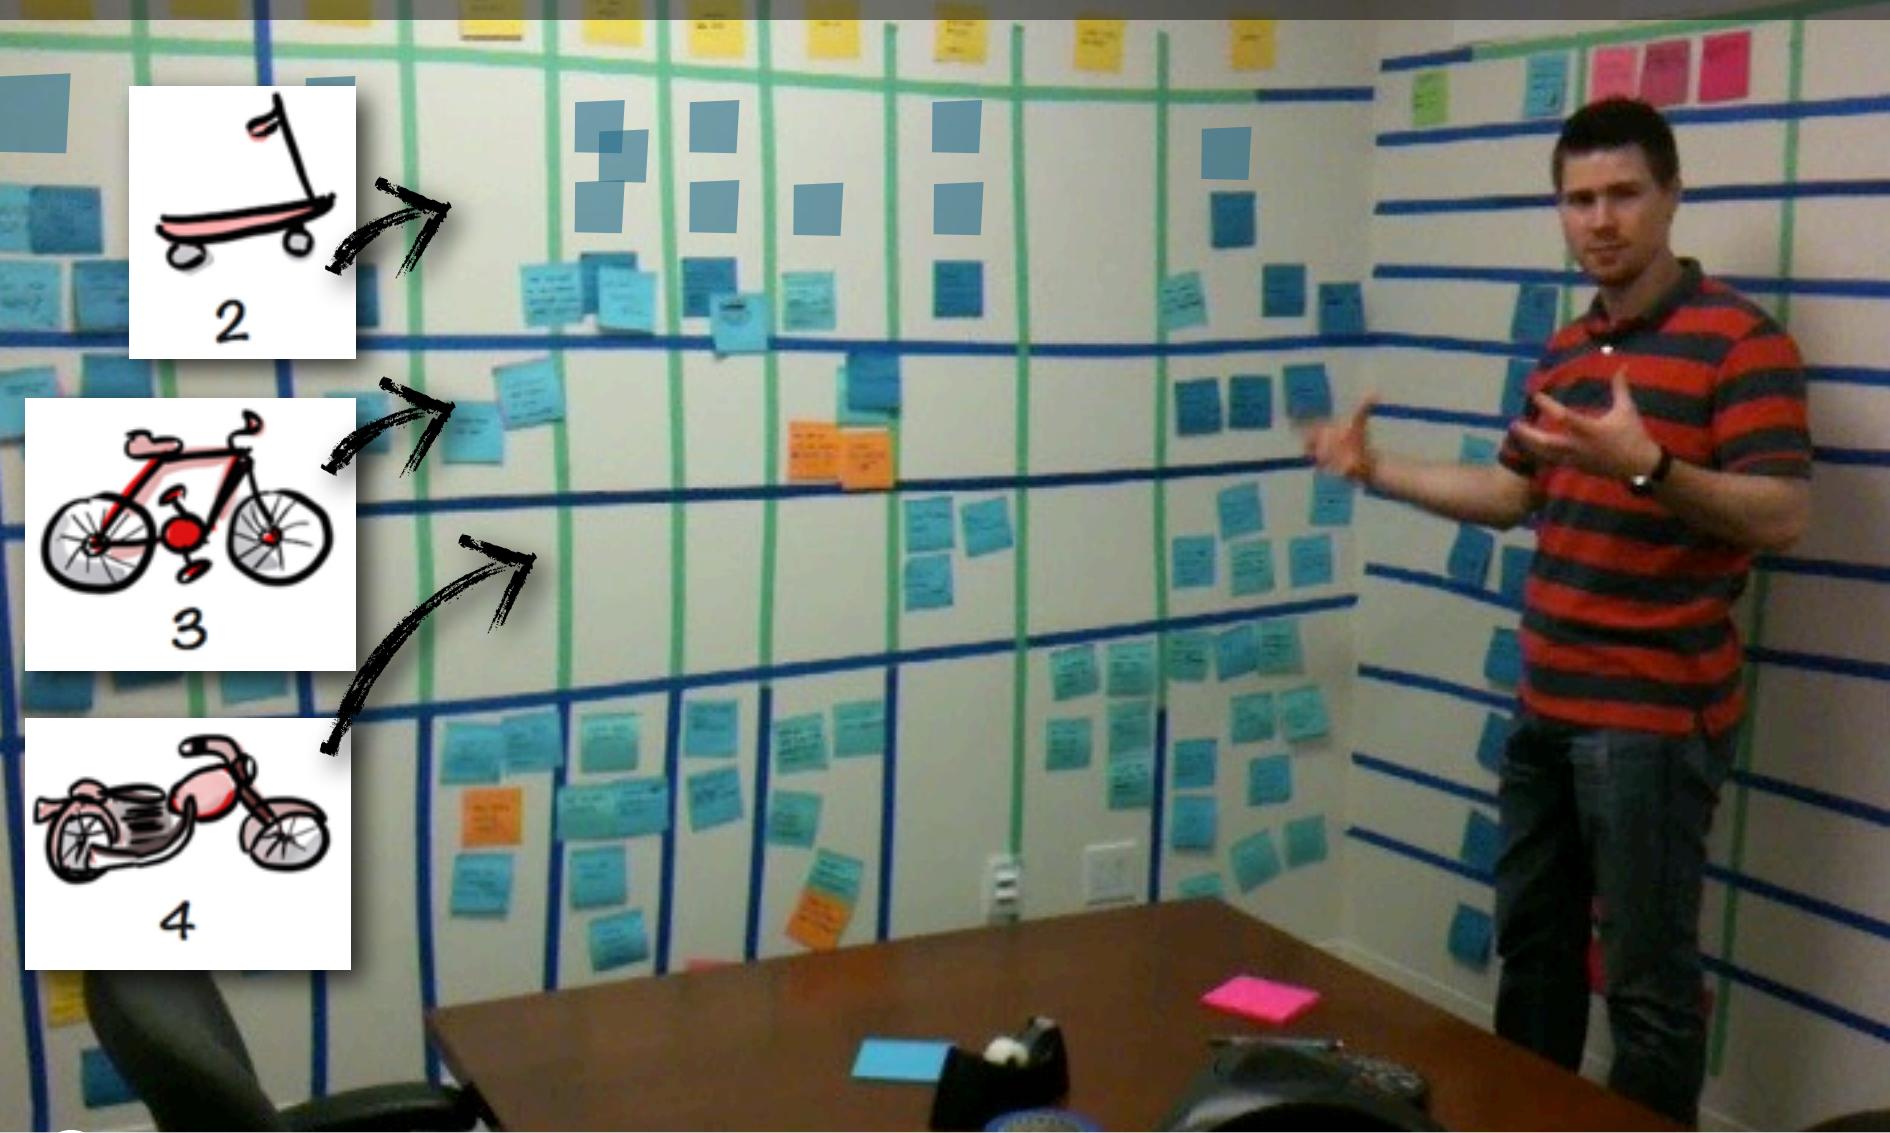

Deliver minimum viable product tests to a smaller audience to find what's really viable

## Hypothesis:

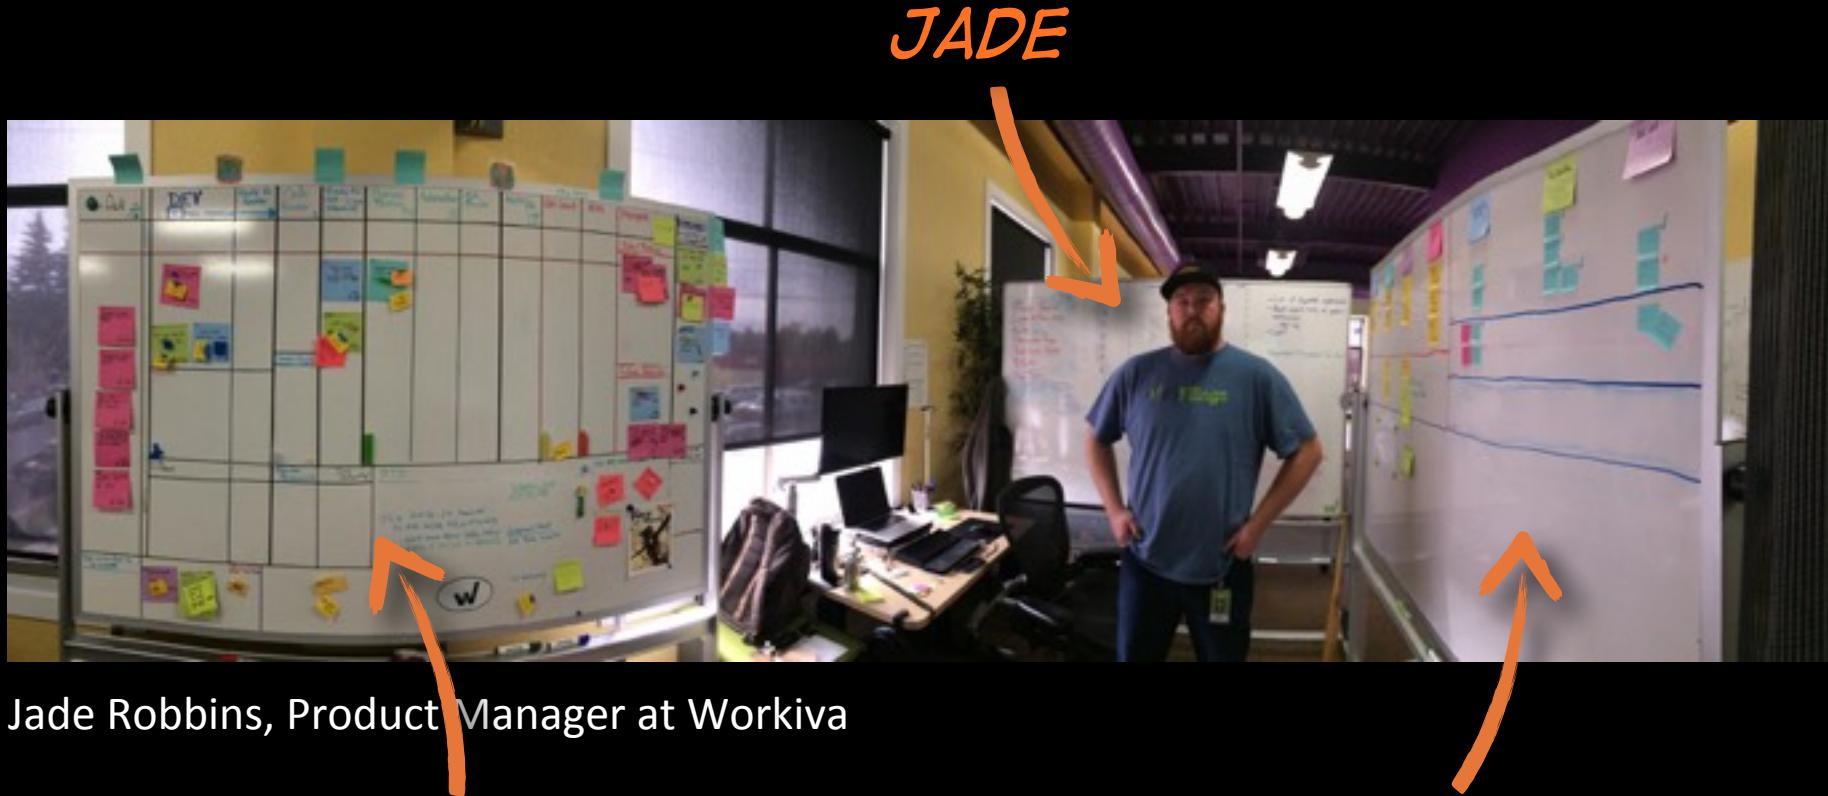

\* Artwork and concept described by Henrik Kniberg

# Eric has organized his backlog into a series of release slices

# Jade releases to learn

Jade Robbins, Product Manager at Workiva

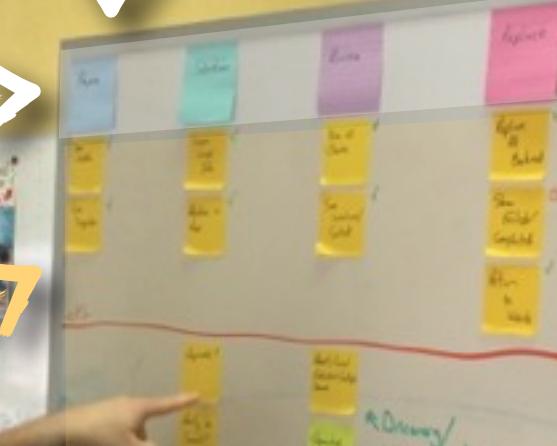

*THE TEAM'S  
TASK BOARD*

*JADE'S BACKLOG*

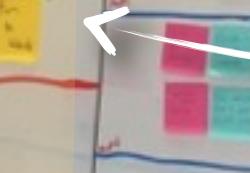

## 2 FEATURES HE'S WORKING ON:

THE "BACKBONE"  
OF HIS FEATURE  
MAP

SMALLER  
STORIES

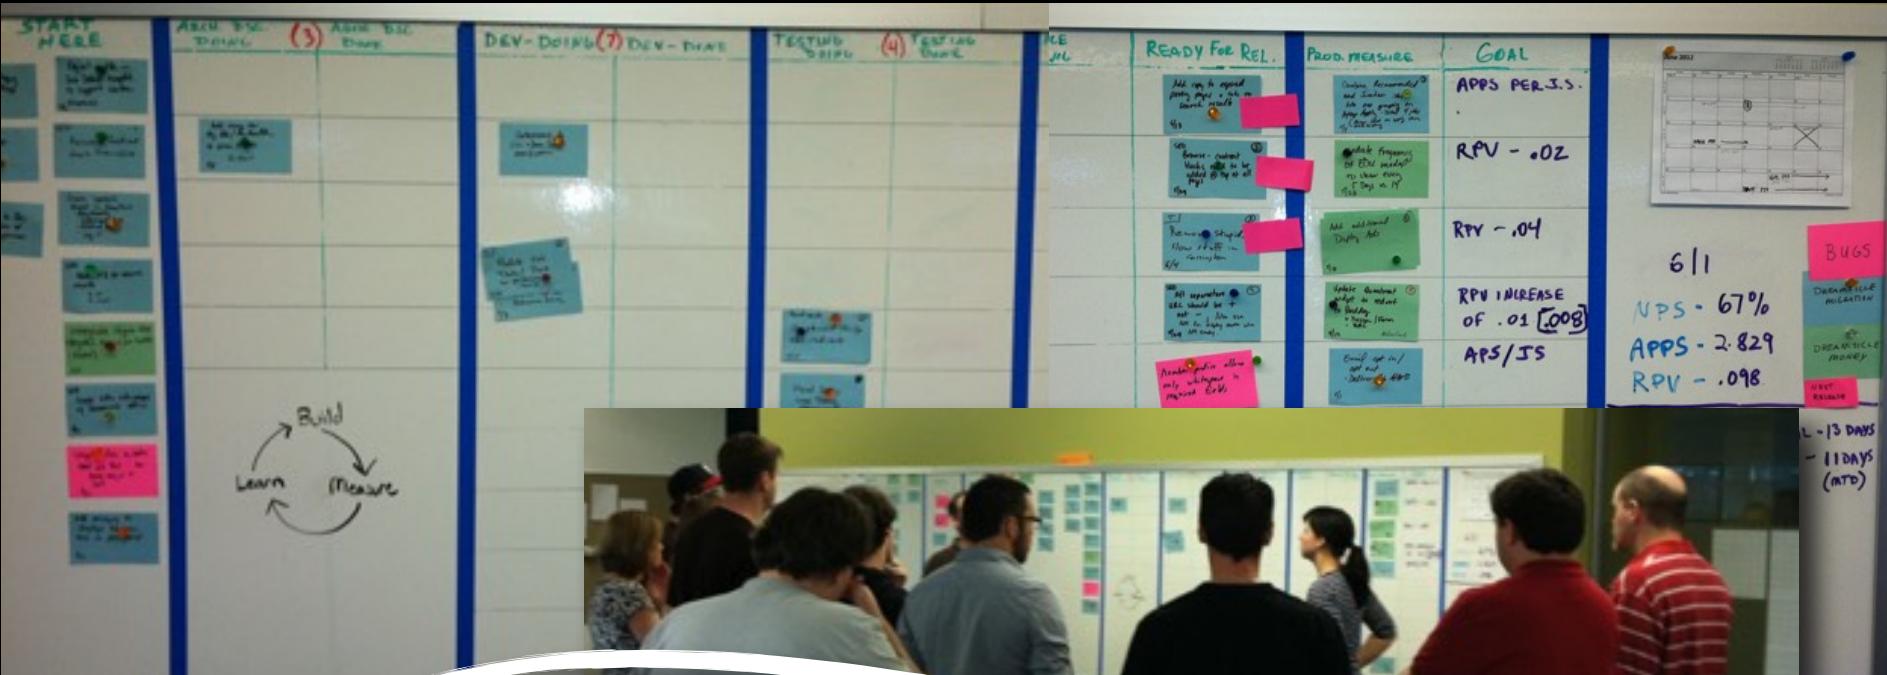

FIRST RELEASE

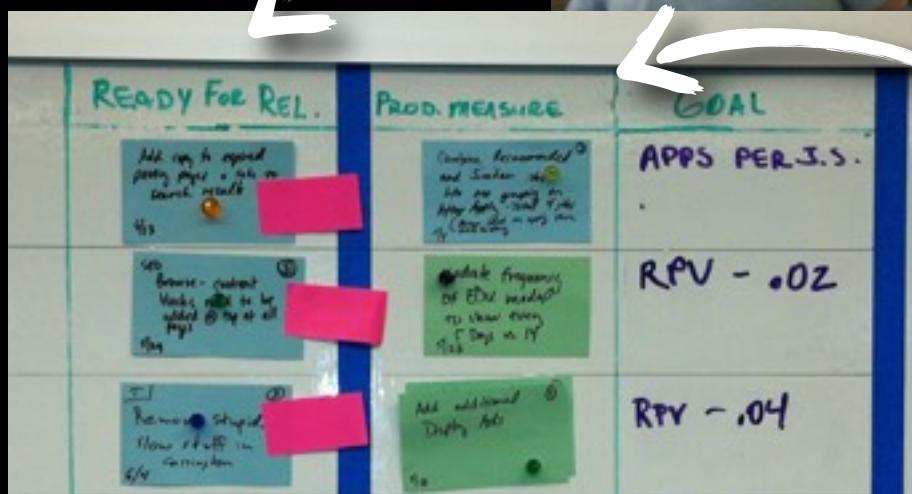

NEXT RELEASE

*EXPLICIT RELEASE STEP*

*EXPLICIT MEASURE STEP & METRICS*

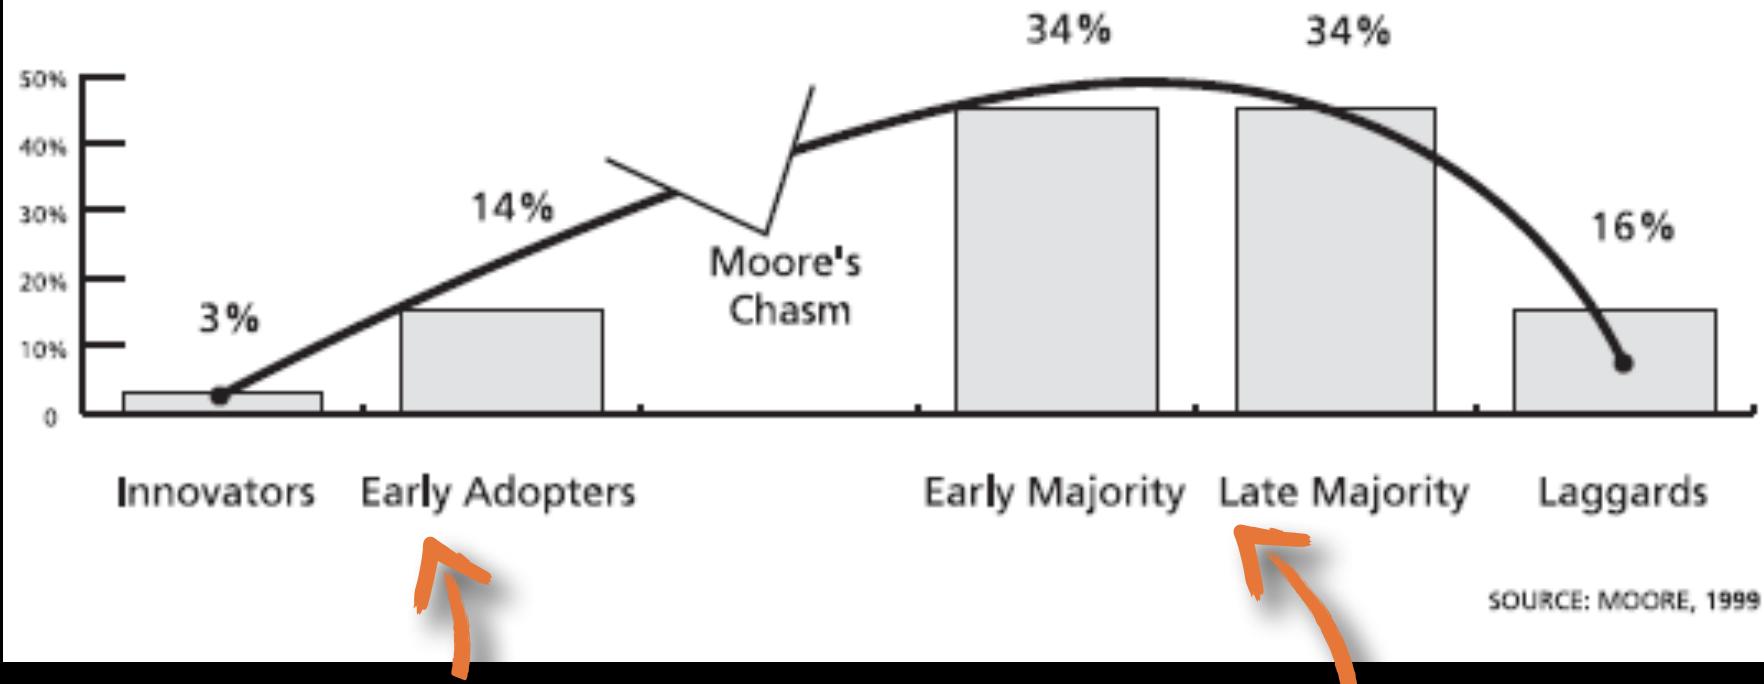

*NOTHING LEAVES THEIR BOARD  
UNTIL THERE'S BEEN A  
DISCUSSION ON WHAT THEY'VE  
LEARNED*

# All your users aren't guinea pigs: Use customer development partners

Geoffrey Moore's Adoption Curve

*RELEASE EXPERIMENTS  
TO DEVELOPMENT  
PARTNERS*

*WHEN YOU'RE  
CONFIDENT IT'S VIABLE,  
RELEASE GENERALLY*

Use maps to focus  
release strategy on  
specific learning  
outcomes

# A safer way to deliver on time

Use maps to focus  
development strategy  
on reducing delivery  
risk

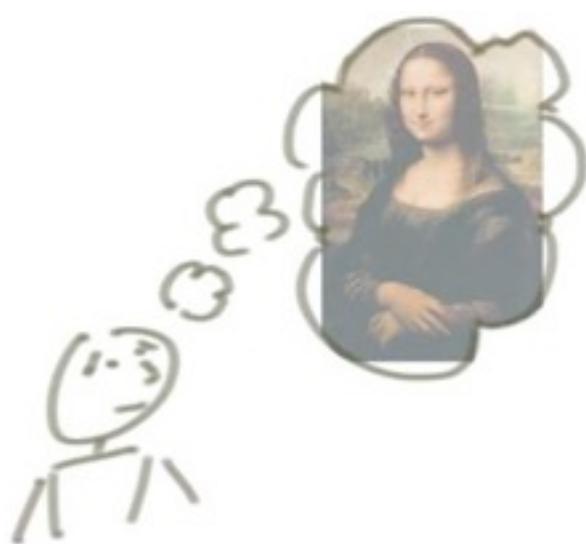

“accurate estimate” is  
an oxymoron

To release benefit on a  
schedule we'll need to  
budget, and leverage  
incremental and iterative  
thinking

(What's the difference?)

# “incrementing” builds a bit at a time

Incrementing calls for a fully formed idea.

And, doing it on time requires dead accurate estimation.

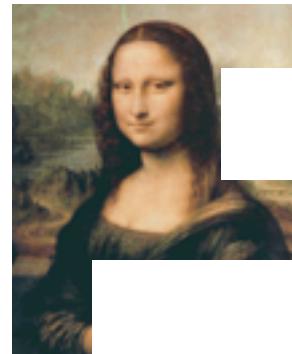

1

2

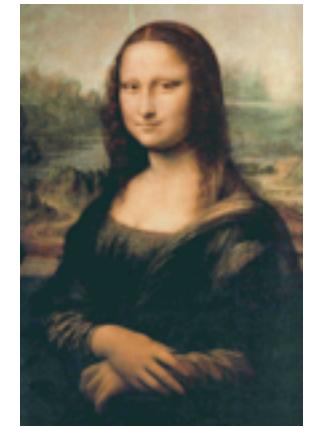

3

4

5

# “iterating” and “incrementing” builds a rough version, validates it, then slowly builds up quality

A more iterative allows you to move from vague idea to realization making course corrections as you go.

1

2

3

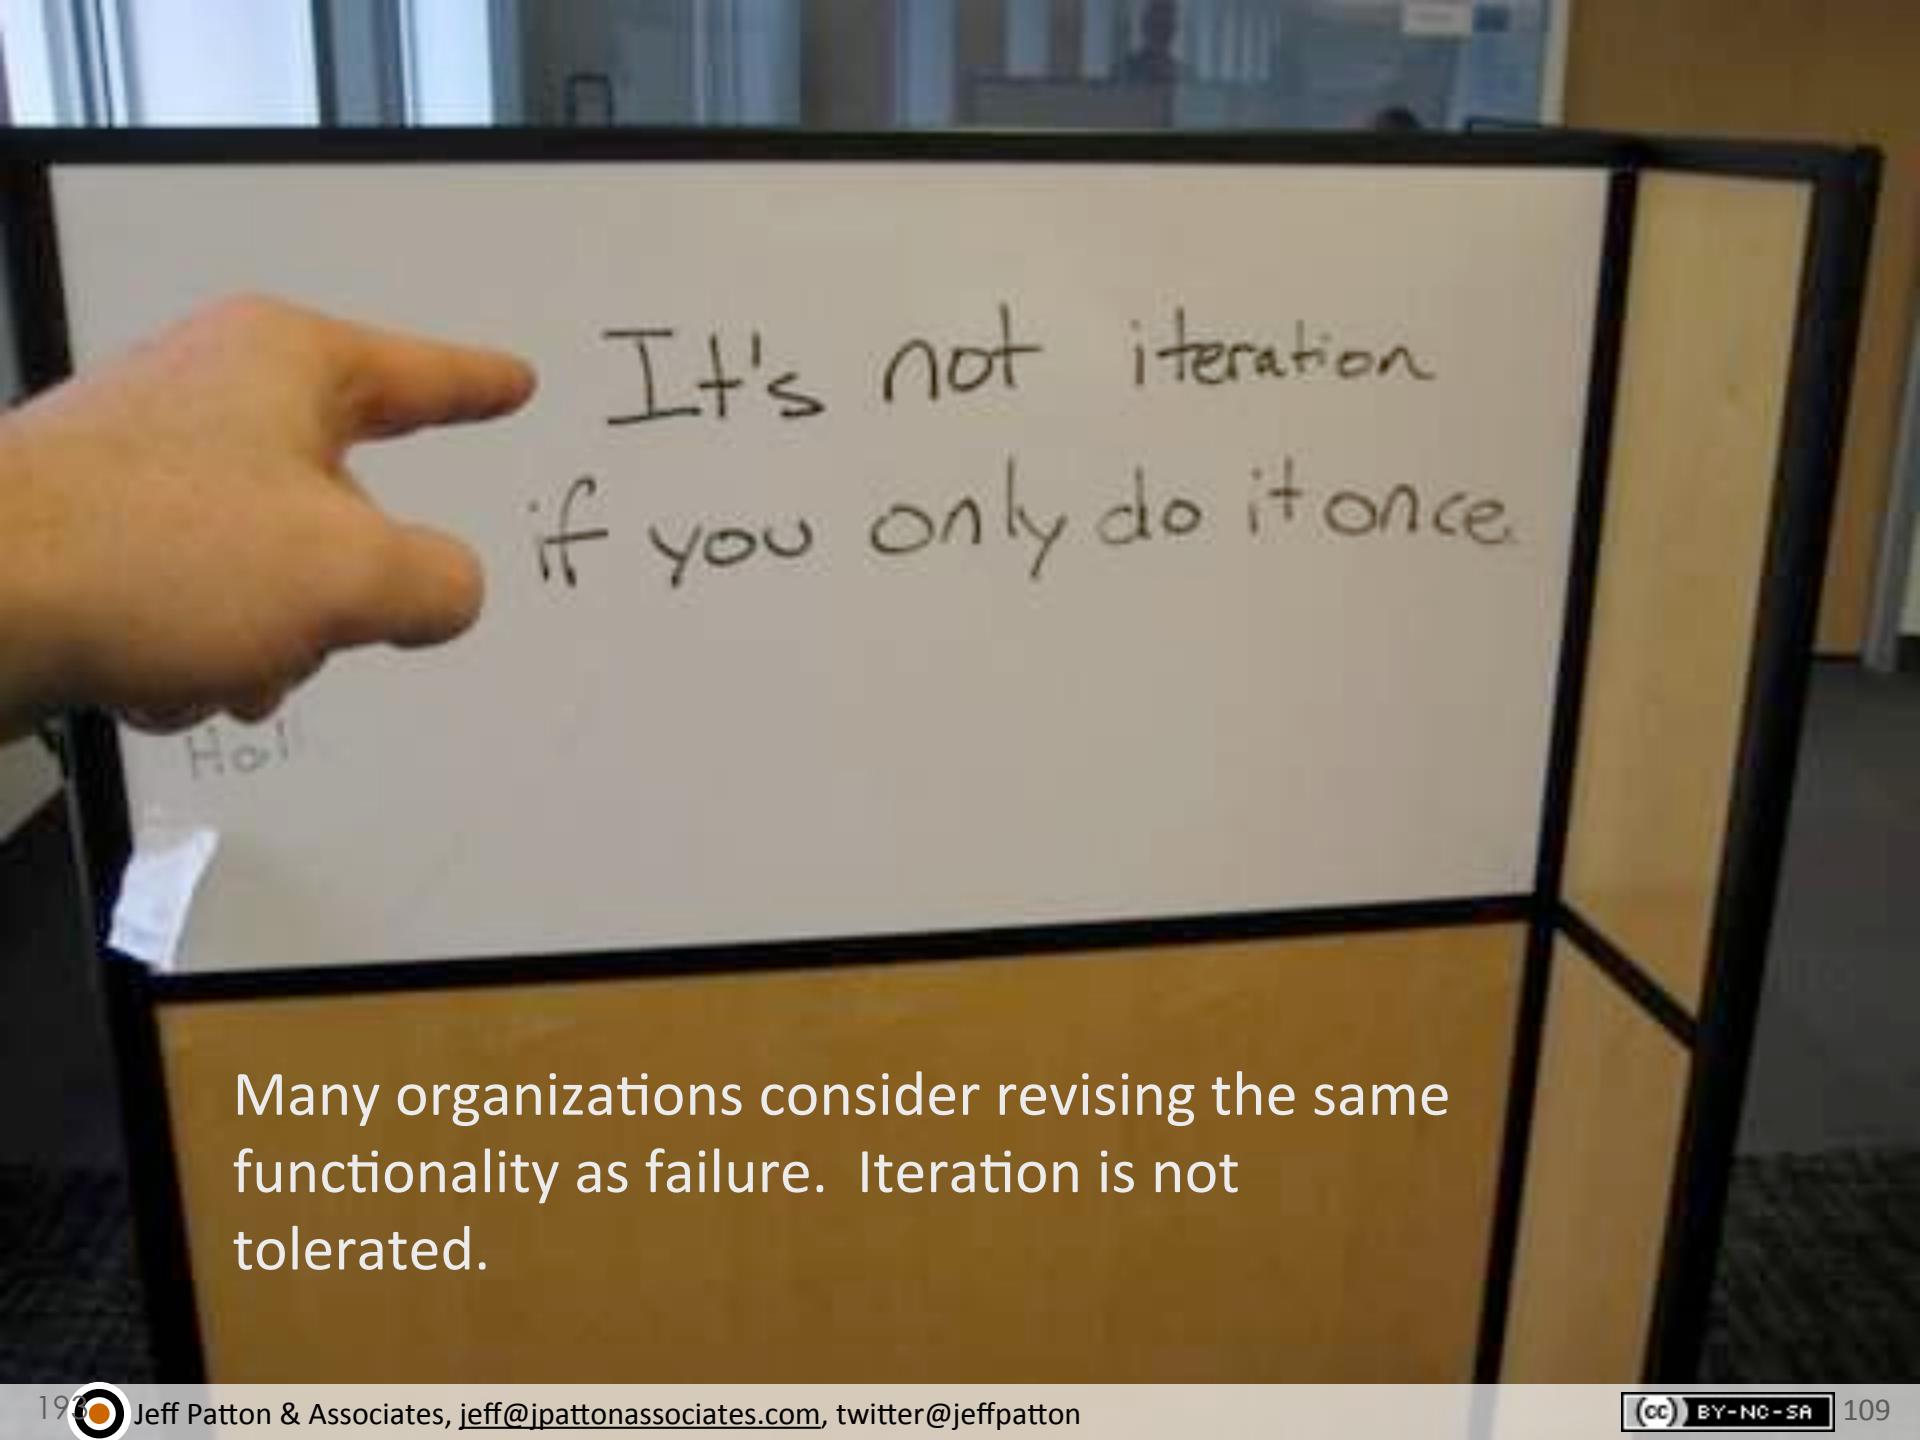

4

5

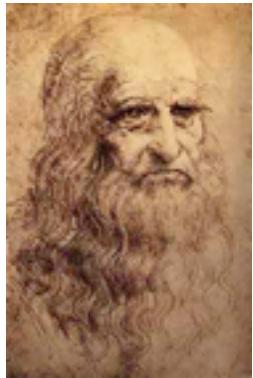

It's not iteration  
if you only do it once

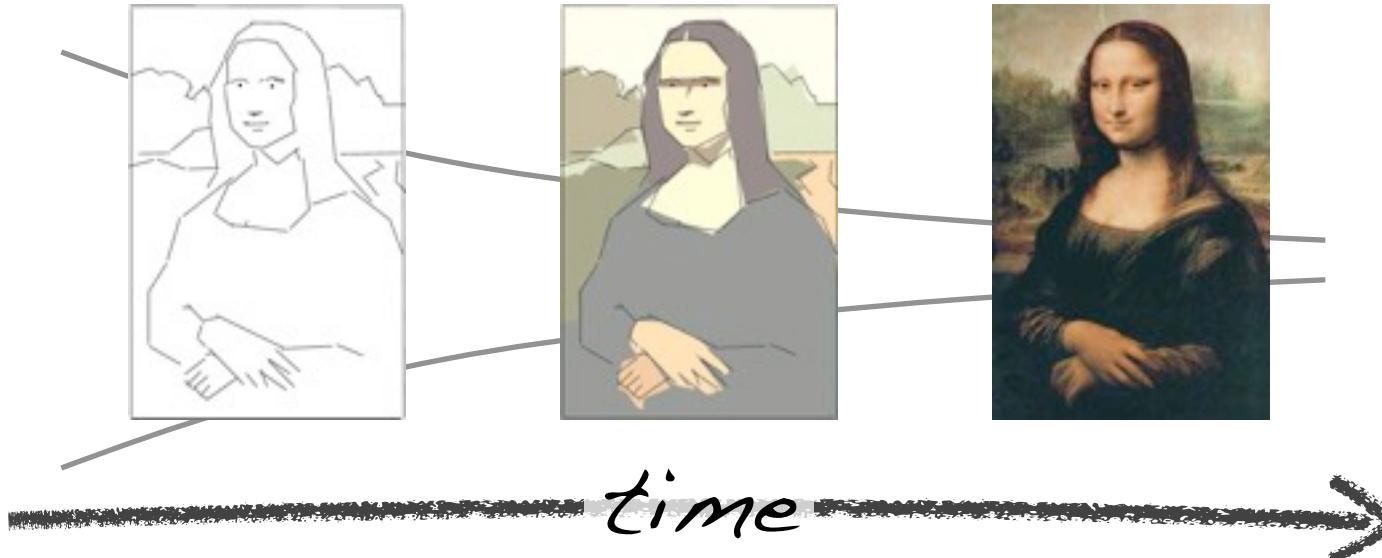

Many organizations consider revising the same functionality as failure. Iteration is not tolerated.

# Work like an artist to envision and build the product holistically

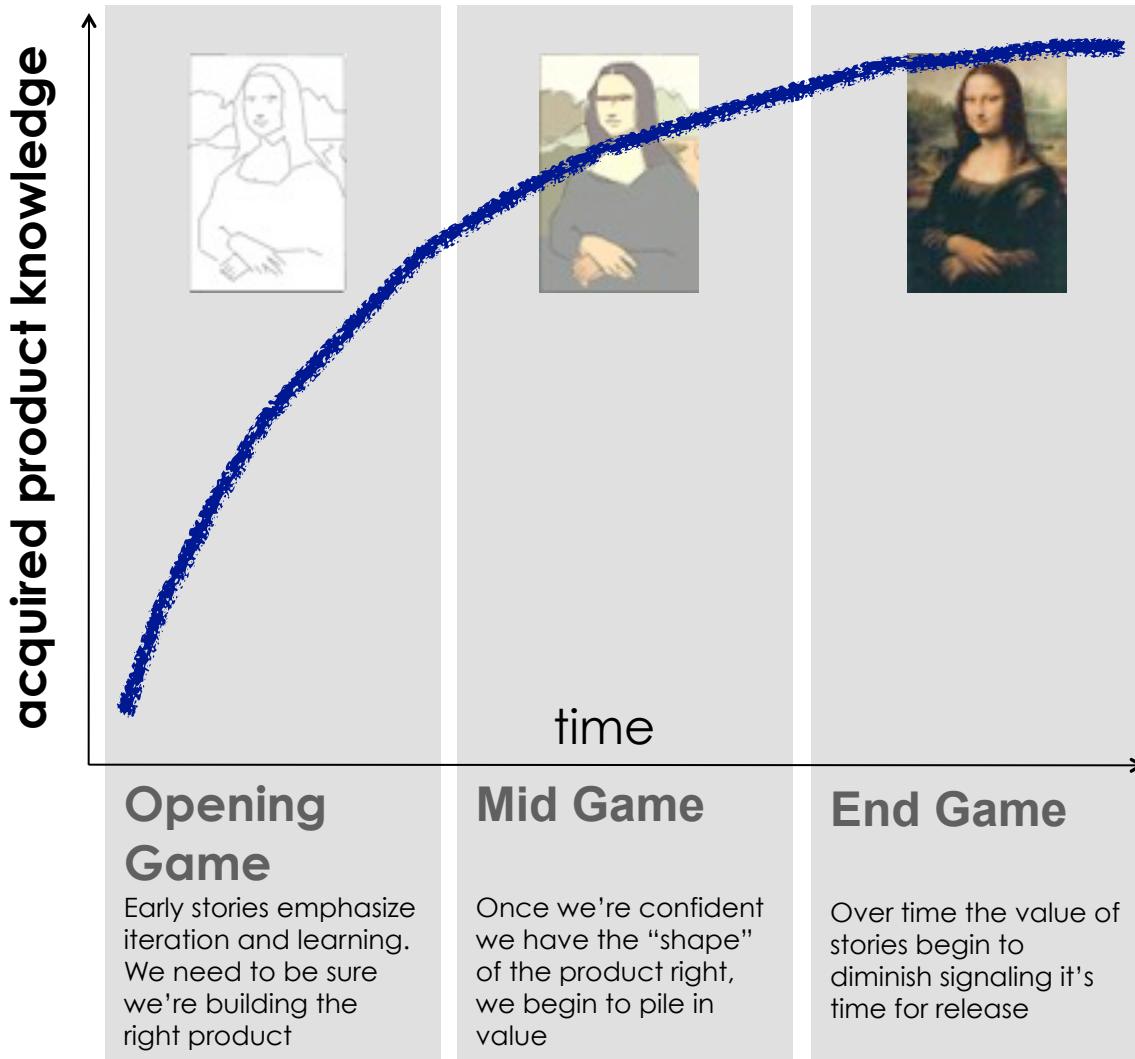

“Art is never finished,  
only abandoned.”

-Leonardo DaVinci

# Organize work to maximize learning

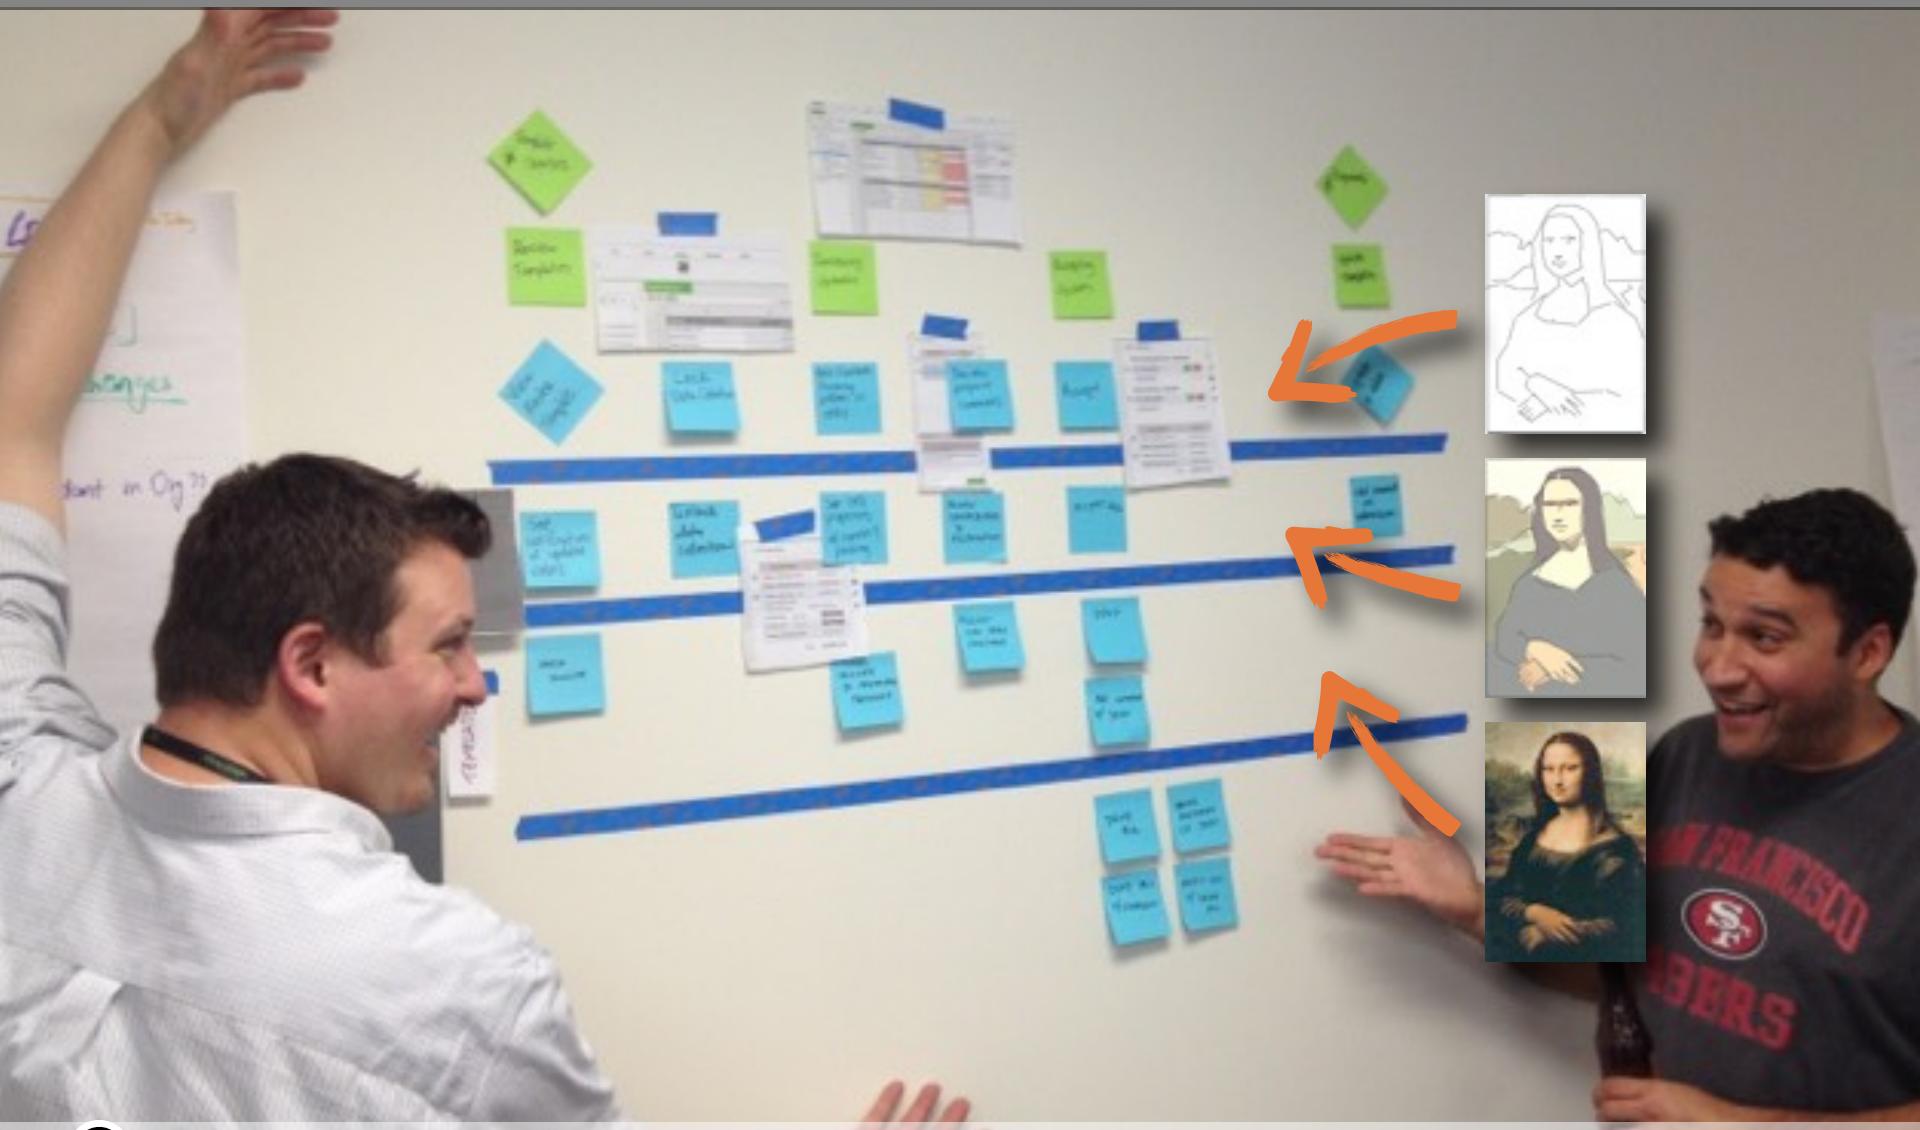

The inverse of risk is knowledge

Learning earlier about delivery risks helps us finish on time

Alistair Cockburn refers to cutting the small “polishing” stories as “trimming the tail.”

# Use a story map to slice out a delivery strategy

# Product Owners must understand the delivery strategy that leads to a finished product

Sculpture at various stages of completion, Musée d'Orsay, Paris

Build up software  
iteratively and  
incrementally to release  
the highest quality  
possible on time

1. Change the way you work: tell stories, don't just write them
2. Use simple visualizations to anchor the stories you tell
3. Map the whole story to find the parts that matter most
4. Think things through: minimize output, maximize outcome and impact
5. Build minimum viable product tests to find what's minimum and viable in the market
6. Build your product up iteratively and incrementally

Effective stories help everyone work towards product success
